Acorn's new machine

ACORN is to launch its new up-market micro in September, aimed at professional, business and advanced home users.

To be called the Professional Workstation Range the machine (previously called the ABM) will be offered in a variety of configurations.

Each will include a built-in monitor and disc drive, and use the 6802 chip — the same as in the BBC machine — as its 'core processor.'

The 6802 will not, however, be the main processor. It will be used as the controller — handling the keyboard, screen and input/output operations for

a range of other second-processor options. At the low end of the Professional Workstation Range the machine will be offered with a 280 processor running CP/M. At the upper end of the range the machine will feature the new 32/32 Motorola version of its 68000 chip series, the 68032, running a

Unix-like multi-user multi-tasking operating system — possibly a version of Xenix.

"The Professional Workstation will be core compatible with the 6802. By adding different processors you will be able to add rims of functionality

continued on page 5

Slow start for MSX companies

MACHINES from the majority of the Japanese MSX companies will not now be available in quantity in shops here, in time for Christmas.

The Hitachi, National Panasonic and Teleton MSX machines will not arrive until next year.

Sanyo, Sony and Canon are all planning their MSX launches in October, but, initially only limited numbers of

Sanyo and Canon machines will be available. David Silver, Sanyo's product manager, commented, "We will be going for full production in early 1985."

Mitsubishi will be making a standard joystick and data recorder available at the same time, with a printer to come in 1985. Sony and Sanyo will also

continued on page 5

Sinclair to drop 16K from plan

SINCLAIR has announced its plans for the Autumn and the 16K Spectrum is not included.

"We will still manufacture the 16K machine and sell it overseas, but it is not a product we will promote in this country this Christmas," confirmed Anton Boyes, Sinclair's retail business manager. "At the moment 95 per cent of our sales and most of the software is for the 48K machine."

The company has announced a special offer for the 48K Spectrum involving a free gift of £56.70 worth of software and both the QL and the flat-screen TV will be in the high street shops in September.

From August 8, the 48K Spectrum will be sold with a free pack of six programs — *Cherished Flag*, *Scrabble*, *Make-a-Chip*, *Survival*, *Chess* and

Horace Goes Skiing. This 'Spectrum Six-pack' offer will continue while stocks — 1/4m packs worth £14m — last, probably until the end of September.

The Microdrives will also be sold as a special pack, from October onwards. With Christmas presents in mind, the Microdrive System Expansion

NEW

Pandora by Harry Bates. Reproduced by kind permission of The Tate Gallery, London

SPECTRUM 48K

£5.95

Once upon a time, Zeus had one of his master craftsmen fashion a mortal of perfect beauty — the first woman — he called her Pandora — meaning "all gifts". Zeus presented her with a golden casket, but bade her promise never to open it, but Pandora grew curious and one day she lifted the lid. With a rush and a cry, out came all the ills that now beset man; disease and sorrow, hate, jealousy, theft, lies and many more. Pandora rushed to close the lid, but all of its contents had escaped, save one, "Hope". Since that ill-fated day when Pandora infested the world with terrible woes and suffering, Hope has always remained a comfort to this troubled world — until now! Someone has stolen Hope, and famine, disease and violence have taken over the world.

Enter the magnificent and dangerous world of Ancient Greek Legend in this amazing hi-res graphic adventure. One-eyed giant Cyclops and the many headed Hydra are but a few of the incredible creatures you will meet as you sail treacherous seas and cross dangerous landscapes in your struggle to return Hope to its guardians on Mount Olympus, the home of the Gods.

BBC 'B' or ACORN ELECTRON

£7.95

Guy of Gisburne, treacherous henchman of the Sheriff of Nottingham, has captured the lovely Maid Marion. In his heavily defended castle — he holds her as bait!

Become Robin of Loxley, the hooded man, on a mission of rescue and vengeance.

Written in 100% machine code and making full use of the sound, colour and hi-res capabilities of each computer, Gisburne's Castle blends the action of the arcade with the challenge of an adventure, into one outstanding game.

Features:

- * Hundreds of different graphic locations
- * 20 different animated and intelligent characters
- * 15 different objects to be found and used
- * Joystick option and user definable keys

THE Japanese MSX companies work in mysterious ways.

Here you have the world's most successful electronics manufacturers deciding to jointly tackle the micro market.

Yet, instead of a unified launch by the ten manufacturers, well in time for the peak Christmas selling period, they have chosen to act separately, each with its own different launch schedule.

The timings look curious to say the least.

National Panasonic, Teleton and Hitachi will not launch until next year — Hitachi actually announced an '84 launch and then changed its mind. Mitsubishi is hoping for first deliveries in mid-November — too late to make much headway at Christmas. And Sanyo and Canon, though launching in October expect initially to have available only limited quantities of machines.

The only MSX manufacturers which look as if they may get enough machines in the shops to make an impact at Christmas are Sony and Toshiba.

All of which is rather non-plussing. MSX was launched in Japan at the tail end of 1983 and its planned arrival in the UK this Autumn was announced way back in the Spring of this year.

Sinclair, Amstrad, Acorn and Commodore must be watching the proceedings with considerable interest. Amstrad's distribution, which already looks pretty good, should ensure the machine success and Sinclair last week announced that its QL computer will be in the shops in September — again in good time for Christmas.

The MSX standard is a gamble which the Japanese companies will either win or lose.

Not until the Japanese manufacturers can present a concerted attack on the micro market will it be possible to regard MSX as a true 'standard'.

How to submit articles Articles which are submitted for publication should not be more than 2000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted. **Accuracy** Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Paranoid PETE

Amstrad version
available September

UBIK
SOFTWARE

Dealer & Distribution
enquiries welcome

Due to the World-Wide shortage of wheat, Paranoid Pete - the intrepid space farmer - has travelled to the Planet Owwayondah in an effort to grow new crops and send them back to earth. The game starts when Paranoid Pete is beamed onto the Planet surface, he then has to plant the wheat seeds as they fall from the U.S.S. Harvester. This is achieved by digging directly underneath the falling seed with the spade and then filling the hole in, but it is not quite that easy as the planet has been infested with Mega-wibbles. The greediest little critters in the Universe! and Pete has to defend himself and his crops by giving the Mega-wibbles a sound bash on the head with his spade. Once his plant(s) have been successfully grown the arm of the ever friendly Ubik-Droid collects the wheat and takes it up into the U.S.S. harvester for processing, subsequently, Pete is beamed back on-board to ensure everything runs smoothly because the Mega-wibbles have materialised on board and are intent on destroying Petes cargo of Ubik-Wheat. Pete has to successfully process eight boxes of Ubik-Wheat for every plant grown to gain access to the next level of play. With two highly colourful games screens, three lives and five levels of increasingly difficult play can you help Paranoid Pete to save the world or will the Mega-wibbles have you and the Ubik-Wheat for breakfast.

Acorn

continued from page 1

to meet all sorts of needs," explained an Acorn spokesman.

The additional processor units will be linked by a development of Acorn's Tube interface currently used with the second processor add-ons for the BBC machine. "With The

Acorn's managing director Chris Curry

Tube we have a particular advantage over our competitors and we would be foolish not to use it," continued the spokesman.

"What will come out in September will not be another QL — it will be a machine people will actually want to use".

Legal action over copying

DEVON Trading Standards Authority is the latest body to take legal action over software piracy.

It received a complaint from Crystal Electronics in Torquay, that copies of its *Xtal Basic* program for the Sharp MZ80K and photocopies of the accompanying manual were being hired out in Yorkshire.

Howard Austin, a nineteen year-old from Pudsey in West Yorkshire, pleaded guilty at Teignmouth Magistrates Court to three offences against the Trades Description Act, two against the Copyright Act and one against the Forgery and Counterfeit Act.

Michael Cheney, solicitor for the Trading Standards Authority, said, "We took the view that the accused was in breach of copyright of the printed word in that he was photocopying the program's manual. It is a breach of the Trades Description

MTX price drop

MEMOTECH will be cutting the price of its MTX 500 machine from September.

Currently selling at £275.00, it will drop to £199.99, and five free games cassettes worth £30 will be included in the package.

Latest from Legend

THE eagerly awaited follow-up to Legend's *Valhalla* is scheduled for October and will be entitled *The Great Space Race*.

The program, described as a 'spectacular futuristic romp' by Legend will be released for the Spectrum and the Commodore 64 simultaneously.

At first glance the game looks like a radical departure from *Valhalla*. "It's a bit like an arcade game in that you are up against a clock and under continuous pressure but it has a richness of structure hardly found in even the best adventure and strategy games," says Legend's John Peel.

The game is seen as a further development towards the computer 'movie' concept. Like *Valhalla*, characters within the game exhibit independent personalities and the

MSX

continued from page 1

be launching peripherals — as yet unspecified — with their computers in October, while Yoshio Yamashita, product coordinator for Canon, said that as yet, no peripherals were planned from Canon.

The first MSX machine to arrive in the UK will almost certainly be Toshiba's — in September.

The Toshiba 64K micro, called the HX-10, will cost £279.00, and Toshiba will be launching a standard joystick at the same time for £14.95. In October, a printer/plotter called the HX-P570 at £249.00 and a dot matrix printer at £349.00 will be available.

According to Chris Greet, Toshiba's product manager, the plotter is "a four-pen device with a speed of 285 steps per second which takes any paper up to A4 size and connects with

tion Act to supply something protected as copyright as original when it is not, and we added the offence under the Forgery Act because he was passing the program and documentation off as genuine when it was a copy.

"*Xtal Basic* was only one of the programs on Austin's catalogue of software available."

Austin was fined a total of £40 with £50 costs. He was given a six month conditional discharge.

graphics are controlled by a computer 'director'. "Not only are the graphic displays in true solid 3D but what you see depends on a complex logic controlled by the computer," continued John.

The plot of the game is in two sections. In the first you compete with computer-controlled players to get the best machinery, stores, equipment and personnel for your spaceship. The second section is the race itself — first to reach a distant corner of the universe.

Unlike *Valhalla* which understands a range of typed-in instructions *The Great Space Race* uses a form of single-key press input. "What happens is that for any given situation a number of logical alternatives from which you may choose are displayed in the top of the screen — it is perfectly possible you may never get the same combination of alternatives twice in the game."

The game uses a special operating system Movisoft 3 as its basis — a development of the original Movisoft system used in *Valhalla*. By the time of its release Legend expects to have spent over £0.25m on its development believed to be the largest amount ever spent on the development of a single computer game.

a Centronics interface."

The dot-matrix printer, the HX-P560, prints at 105 characters per second over 80 columns. It operates with tractor or friction feed and again can use any paper up to A4 size. It also connects to a Centronics interface.

However, Toshiba's disc

drive, originally based on the Sony 3 1/2 inch drive mechanism and due here before Christmas will not now appear until next year. "We are now working on a 3 1/2 inch disc drive of our own design and manufacture," continued Chris Greet. "The first of these will come off the production line in Japan just before Christmas."

Sinclair

continued from page 1

Pack will consist of the micro-drive and Interface 1 plus four microdrive cartridges. These will contain an *Introduction To Your Microdrive* demonstration program, a 'utility' cartridge featuring *Tasword 2* from Tasman and Campbell Systems' *Masterfile*, a games-orientated cartridge with Quicksilver's *3D Air Attack* and *Games Designer*, and a blank cartridge. Sinclair will be advertising on TV for the first time, with this package.

Sinclair's managing director Nigel Searle cautioned that retail stocks of the QL and flat-screen TV would be limited to begin with, and that demand

would exceed supply. Thorn EMI Datatech's production of the QL is being stepped up to 80,000 units per month, and Sinclair has appointed Timex as a second source for the manufacture of the pocket TV. Two new sub-contractors, AB Electronics of Wales, and Samsung of Korea, have been appointed to assemble the Spectrum.

Nigel Searle also announced that Sinclair was within a week clearing the backlog of QL mail orders — 15-20,000 having been delivered. With the QL available on retail, mail order advertising has been discontinued.

● Scicon, in conjunction with OE Ltd, will be producing a communications package for the QL. An interface with a terminal emulator comprises one pack, and a modem will also be available. No prices have yet been fixed. More information from Scicon, 49 Berners Street, London W1.

WE are informed by Beau-Jolly, distributors of software under the Imagine label, that it has no evidence of cut-price Imagine tapes having been sold to a German distributor, as reported in PCW, July 12.

WIN THIS FABULOUS GOLDEN TREASURE, THE FAMOUS GOLDEN JEWELLED HARE OF 'MASQUERADE' OR £30,000

WITH
HARERAISER
FROM
HARESOF

HARESOFT is an intriguing puzzle of animals, graphics and text produced in 2 parts, purchasers of which will have the necessary information and be eligible for entry into a competition to discover the location of the hare. To avoid disclosure of the country side the treasure has not been buried, the winner is asked to pinpoint its location, to claim this superb prize. Part 1, Hareraiser, Prelude, is on sale NOW. Part 2, Hareriser (Finale), from mid September. Both parts can be ordered on our application. This is a BINGO opportunity, you or your family could solve this intricate puzzle and win this beautiful treasure. Be sure of your participation. Order NOW and avoid disappointment. Finer's keeps it!

A turn for the worse

I thought I ought to write concerning your magazine.

It has changed from a serious, slim, glossy magazine, to a more news-orientated one, to a games mag. Your editorials appear to be written by *Sun* journalists — short, snappy and eye-catching. All definitely a turn for the worst.

I'm not too keen on the new layout either — but I'm sure I'll get used to it soon enough. And I've noticed the price-drop too. From 40p to Only 40p.

All I want to know is when is the £1,000,000 Bingo going to start?

Vincent Graff

THE GREAT SPACE

A black and white image of a spiral galaxy, viewed from an angle that creates a sense of depth. The galaxy's core is a bright, dense point of light, from which two prominent spiral arms emerge, winding outwards. The arms are composed of numerous stars and interstellar dust, appearing as a complex, textured pattern of light and dark. The background is a deep black, speckled with distant stars of varying brightness. In the lower portion of the image, the word "RACE" is written in a large, bold, stylized font. The letters are white with a thick black outline, giving them a three-dimensional appearance. The font is a slab-serif style, with sharp angles and a slightly irregular, hand-drawn feel. The word is positioned horizontally, spanning most of the width of the lower half of the image.

RACE

Delta Queen

Pilot your paddle steamer up the Mississippi in John de Rivaz's game for the 16 or 48K Spectrum

As captain of the *Delta Queen* you must navigate your way safely up the Mississippi, avoiding the coast, the banks and the bridge supports stretched across the river at various points.

The program could form the basis of a much more involved program but, as it stands, it gives a good game and is still a fairly short listing to type in. For example, one idea would be to give the steering an inertia factor more appropriate to a sluggish river boat.

The score increases with every unit you progress. Hit any object, though, and the *Delta Queen* will veer off into open water — an event announced with a little beep.

Program notes

130-190 Set up machine code with checksum for any size Spectrum
230-260 Print instructions and prepare the screen
290 Draw coast and initialise river banks
300 Main loop entry point.
300-350 Draw a line of picture
380 Put in random bridge supports
410 Note last ship position

420-450

460

470

480

490

530-570

560

Get user-move and check on screen
Check for collision: if so zero score and centre ship
Unplot last ship's position
Plot new ship's position
Scroll bottom $\frac{2}{3}$ screen and update score
If ship hits land or bridge, then push it to open water
Line inserted in case random routines contain a bug that causes river to be blocked!

```

FASTBACK IS HERE

A TYPICAL COMMODORE 64 OWNER WAITING FOR A PROGRAM TO LOAD FROM TAPE... BUT NOT ANY MORE!

At last a utility that provides fast-loading. FASTBACK allows multi-part software to load around 10 TIMES FASTER and run independently of the utility. For example: load 'The Hobbit' in 150 seconds with FASTBACK.

Supplied on tape with full instructions.

ONLY £9.95

THE AMAZING NEW PROGRAM FOR THE 64

Gives unlimited vocabulary and can be incorporated into your own programs using "SPEAK" as a basic command.

ONLY £7.95 NOW YOUR TALKING!

AND FOR DISC USERS

DISCO

Our latest and most sophisticated Tape-to-Disc utility is so easy even a child can use it. DISCO creates its own buffer steps to ease the job of transfer. All programs auto run once transferred. We guarantee this is the best Tape-to-Disc you can buy.

Supplied on tape with full instructions

ONLY £9.95

-TAPE TO DISK TRANSFER UTILITIES-

Transfer games etc. to disk. Supplied on tape with full instructions for:-

BBC

ATARI (All models)

£9.95

HUGE RANGE OF SOFTWARE & BOOKS FOR BBC, ELECTRON, SPECTRUM, COMMODORE 64, VIC 20, ORIC, DRAGON, MEMOTECH & ZX 81

Trade and Overseas Orders welcome:
All prices inclusive. Send Cheque, P.O., Bank Draft or phone your Card Number to 0586 49641.

If you've ever been killed by the evil goblin, flamed by a dragon or turned to stone by a wizard...

then you need Micro Adventurer—the new monthly magazine devoted to all microcomputer adventures, war games and simulations.

Each issue offers a wide range of stimulating features, including:

- Helpline and Contact columns
- Reviews of the latest adventures
- Competitions with exciting prizes
- War gaming advice
- Adventures to type in and play
- Profiles of famous adventurers
- Advice on how to write your own adventures

If all this sounds too good to be true then fill in the form below to make sure you receive your copy of Micro Adventurer.

SUBSCRIPTION ORDER FORM

Please send me 12 issues (a year's subscription) of Micro Adventurer, beginning with the _____ issue.

Name _____

Address _____

Signature _____ Date _____

This order should be accompanied by a cheque made payable to Micro Adventurer.

UK subscribers

A year's subscription is £10.00 — please send this form with payment to Micro Adventurer, Subscriptions Department, Oakfield House, Perrywood Rd, Haywards Heath, Sussex.

US/Canadian subscribers

A year's subscription at air-speeded rates is US\$33.95 — please send this form with payment to Micro Adventurer, c/o Business Press International, 205 East 42nd St., New York, NY 10017.

QUO VADIS

*"Commodore 64 owners looking
for a Mega-game this Autumn will
not be disappointed"*

This is the modem world

Robin Wilkinson explains how to get started with Networking on your micro

Tired of all those games, frustrated with your latest programming attempt — then it's time you got networking.

More and more services are opening up to let your micro do the walking across BT's public telephone network.

Modems are the hardware that allow your micro to connect to the telephone network and together with the relevant communications software open up a whole new world.

Public networking — connecting to such services as *Prestel* with *Micronet 800*, *BT Gold*, the business electronic mail service and the recently announced *Compunet* — is catching on fast.

Add to that a proliferation of bulletin boards — private services where anything can happen! — other on-line information retrieval systems and the ability to swap data with a friend's micro on the other side of the country and you can see how your micro can be turned into a highly versatile and powerful information terminal.

One couple in the States managed to use networking to date and later get married.

There's just one person you have got to keep an eye on — that's Buzby — and the telephone bill can come as quite a shock. But networking can be reasonably cheap if you restrict yourself to cheap call times and concentrate on databases which offer a local call access node (the jargon for a switch to a remote computer service housed in your local telephone exchange). Your time connected to the computer is charged as a local call.

If you really want to get serious, you could take out an account on the public switchstream service which allows you to dial services around the world at cheaper than normal rates — but the minimum payment is out of the reach of most home users who are just getting started.

There are no simple answers to getting hooked up and like everything it all de-

pends on how much you are prepared to pay and what type of service you wish to access.

A list of service providers and modem manufacturers/distributors is shown in the two panels. Generally, modems will operate with a variety of software packages. When you get a modem you will also need the software so that your micro can make sense of what it is hearing from the modem.

Modems receive and transmit data at a variety of speeds — called the baud rate. Normally this will be (receive/transmit), 300/300, 1200/75 or 1200/1200 bits sec.

Modems with only 300/300 baud are generally cheaper ranging from £45. They can connect to a wide variety of services such as bulletin boards. However, transmitting and receiving data at 300 baud can be slow and therefore has an overhead when it comes to your telephone bill.

Modems with only a 1200/75 rating have a more limited range of services available to them although this speed is beginning to gain acceptance on some bulletin boards. This speed is generally used for viewdata services like *Prestel* and *Compunet* where the host main frame or mini is transmitting more data to you than you are sending back to it. In this instance about 1K of data reaches you at 1,200 baud in around seven seconds. You send back at only 75 baud which is quite adequate for electronic messages but not really any good for uploading long files.

A typical *Prestel* page, for example, containing around 120 words (display is in teletext format) transmit in seven seconds. Costs for these 1200/75 only modems start at around £55.

More and more modems now couple 1200/75 operation with 1200/1200 — then you are really in business. You can transmit data back to the host quite quickly or to another micro providing

you have the correct software and compatible modems. Costs for those more versatile units start from £70.

The ideal modem is one which combines all these facilities 300/300, 1200/75 and 1200/1200. Here the cost climbs to above £125 but with component costs still falling and interest high, you can expect prices to drop in early '85.

There is also a wide variety of terminal emulation software around

Below is a compilation of services available to modem owners, together with the baud speed of the access ports. It is well worth checking, where possible, with the system operator, to see whether your software is compatible.

MAJOR SERVICES

Prestel Microcomputing including *Micronet 800* and *Viewfax 258*.

A viewdata service running at 1200/75 baud with local call access around 92% of the country. There is also 300/300 baud access, but only on a London number. Minimum subscription is £20 per year for *Prestel* and £32 a year for the microcomputing section which offers news, downloading of free and commercial software, electronic mail, telex and teleshopping.

Contact: *Micronet 800* (Tel: 01-278 3143) or *Viewfax 258* (Tel: 021-705 0258).

Compunet

A viewdata system with advanced features for personal computer operated jointly by Commodore and the ADP Network. Local call access at six points around the UK. Facilities include ability to upload your own software or information to the host system. Launch date of service is late September. Port speeds 1200/75 baud.

Contact ADP (Tel: 01-637 1355) or Commodore Information Centre (before August 17 Tel: (Slough) 74111. After August 17 Tel: (0536) 205252).

BT Gold

Really an up-market electronic mail teletext system but does have special-interest group bulletins. Port speeds 1200/75 or 1200/1200 baud. Mainly for corporate company communications. Tel: 01-403 6777.

Dialogue

A mammoth database with access via PSS or direct to London. *Dialogue* contains numerous distinct databases on subjects from world affairs through to chemistry, economics and has a special microcomputing section. Operates at 300/300 or 1200/75 baud. You do not need a special PSS account to use (Tel (0865) 730969). SEMI-COMMERCIAL SERVICES

Maptel

Run by Maplin Electronics, provides tele-ordering of equipment and software using credit-card to existing customers. Runs at 300 baud. (Tel (0702) 852941).

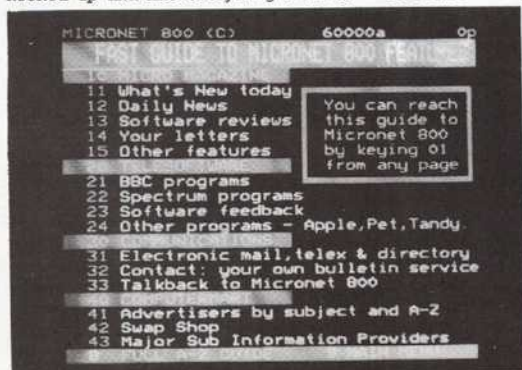

Distel

Run by Display Electronics, *Distel* offers tele-ordering but also bulletin board-type facilities, gossip and news. Runs at 300 and 1200/75 baud. Contact Dave Fisher on (Tel 01-679 1888).

UK BULLETIN BOARDS — ALL FREE

Most bulletin boards operate during the evenings and weekends. Be patient — most operators do it for a hobby. If you get in real trouble type *Help*. Some magazines are even offering their own BB boards now.

CBS South West — Tel (0626) 890014. **Mailbox 80 W Midlands** (0394) 635336. **Forum 80 Hull** — (0482) 859169. **Forum 80 London** 01-302 2546. **CBS London** — 01-398 2136. **Liverpool** — 051-428 8924. **TBS London** — 01-348 9400. **BASUG** — (0742) 667983. **Computer Answers**, London — 01-631 3076. **CBS Surrey** — (04862) 25174. **Blandford** — (0258) 54494. **Southern BB** (0243) 54494. **Birmingham** — (0827) 28810. **Stoke (ITEC)** — (0782) 265078. **West Midlands** — 021-631 3076. **Microweb (BBC Micro User)** — 021-456 4187. **Chiltern** — (07073) 28723. **City London** — (01-606 4194). **Cumbria** — (069) 92314. **Manchester** — (061-427 3711. **Note:** Most BB's operate at 300/300. Those with an asterisk are believed to work at 1200/75.

for home microcomputers ranging from the ZX81, Spectrum, Commodore 64, Dragon, Oric, and BBC up to big-blue IBM, Sirius and Apple.

Most public database providers recommend certain modems and software, which they know operate well with their particular database. Make sure you check on the versatility of the software to connect you to other systems.

If you are looking for a very cheap entry into networking you can do no worse than get a 300/300 modem. Try a user group or a small ad in *PCW* for second-hand one. You

could pick up a cheap modem for £25 and you may get the software for bulletin boards free. However, the level of service and quality of information on these amateur boards varies considerably and they have severe limitations on the number of simultaneous callers possible, and usually only operate at evenings and weekends.

You will find most bulletin board (BB) operators to be enthusiastic and helpful. One of the longest standing is Fred Brown from Hull who operates mainly for Tandy users.

Some commercial services, and indeed some amateur services, are beginning to offer 1200/75 and 300/300 communications.

Professionally operated databases called Remote Computer Services are growing at a rapid rate. They normally operate at 1200/75, 1200/1200 or higher speeds. Examples of these are *Prestel* with a special microcomputing section currently supporting Spectrum, BBC, Commodore 64 and Apple users; *Compunet* for the Commodore 64 (launch due late September); *BT Gold* an up-market electronic mail service with some other features; *Dialogue*, a vast database aimed at researchers; *World Reporter*, a joint BBC/Datasolve service of world news; *Maplin* a catalogue shopping database; and *Distel* a semi-professional bulletin board with commercial teleshopping too, for electrical components.

Robin Wilkinson is a freelance electronic publishing consultant.

Next Week *Popular Computing Weekly* begins a new weekly networking column — *Board Walk*.

Any readers with experience of public networking services are asked to send their experiences or news of new services to Robin Wilkinson, *PCW*, 12-13 Little Newport Street, London WC2R 3LD.

He can also be contacted on *Prestel* mailbox 019993737.

Listed below are the major companies who supply modems for the home microcomputer and small business markets. Some sell only modems, others offer modems with a variety of software packages.

Remember, for simple bulletin board use, readily available terminal emulation packages are available, often from the bulletin board operators or user groups. Send a SAE to operators who in most cases will be pleased to help.

Large database operators will often offer more complex software tailored to their systems. In some cases you will need to identify the types of services you wish to use the modem for and buy one or perhaps two software packages.

Prism Microproducts, 18-29 Mora Street, City Road, London (Tel: 01-253 2277).

Prism offer a variety of modems and software packages mainly for viewdata use and user-to-user. Their modems can be used for bulletin boards with 1200/75 access but you will need to acquire the software.

VTX 8000 — purpose built for the Spectrum with software for viewdata and user-to-user. Cost: £99.95 but enquire about rental scheme also. Bauds: 1200/75 1200/1200.

Modem 1000 — with software on ROM for the BBC to access viewdata and user-to-user. Cost: £89.90. Baud: 1200/75 and 1200/1200.

Modem 2000 — This modem has software controlled send and receive. Available for the Apple with software. Cost: £120. IBM PC, Sirius and Apricot. Cost: £288.85 including *DBase II* run-time viewdata and user-to-user. Bauds: 1200/75 and 1200/1200.

Tandata, Albert Road, Malvern, Worcs (Tel (06845) 68421).

Tandata offer two basic modems with a variety of software packages. Again some are tailored for viewdata.

Tm110 — basic 1200/75 baud modem, autodial. Price £99.
Tm120 — same as Tm110 but also with 75/1200, 1200/1200 and 300/300 baud rates. Cost: £165.

Software packages available for both: BBC (£17), Apple II and IIe (£40 or £75), Commodore Pet (£69), Commodore 64 (£42), Vic 20 (£27), IBM PC (£150) and CP/M machines (£125).

Minor Miracles, PO Box 48, Ipswich (Tel (0473) 50304).

Company supplies the WS2000 modem which is currently awaiting final BT approval and runs at various speeds.

WS 2000 — 300/300, 600/600, 1200/1200 baud. Compatible with European and American (Bell) standards. Cost: £129.95 inc P&P. Software offered for BBC and Apple.

Pace Systems, 92 New Cross St, Bradford (Tel (0274) 729306).

Originally better known for producing the excellent *Comstar* software for the BBC, Pace have now launched their own modem.

Nightingale — 300/300 and 1200/75 baud. Compatible with European and Bell standards. Cost: £136.85. Software for the BBC (*Comstar*) £34 and Apple either software plus card £120.75 or software £69 and serial card £51.75.

OEL Ltd, North Point, Gilwilly, Industrial Estate, Penrith, Cumbria (Tel (0768) 66748).

A long established company offering a variety of modems and software packages.

Pac-M1 — An acoustic modem, 1200/75 baud. Cost: £99.94.

Telemod 1 — A 300/300 baud answer and originate modem. Cost: £99.94.

Telemod 2 — 1200/75 and 1200/1200 baud modem under software control. Cost: £84.95.

VTX 5000 — Operates at 1200/1200 and 1200/75 baud with integral Spectrum viewdata software. Cost: £99.95.

Software is available for a variety of micros from the BBC cassette viewdata software at £13.00 to Commodore 64 cartridge allowing access to a wide range of services at £74.70.

Interlekt Electronics, Reacis House, Portman Road, Reading (Tel (0734) 589551).

Portman — a multi-standard modem offering 1200/1200 and 300/300 and 1200/75 baud with other refinements. Cost: £228.

DaCom Systems, 16 Alston Drive, Bradwell Abbey, Milton Keynes (Tel (0908) 676797)

Buzzbox — Standard 300/300 baud modem. Cost: £79.95.

DSL 2123 — 1200/1200, 1200/75, 300/300 and 75/1200 baud modem. Cost: £280.

Display Electronics, 28-32 Biggin Way, Upper Norwood, London (Tel (01-679 4414).

The company offers its own bulletin board service and specialises in stocking very cheap modems which have been superseded by more fashionable-looking ones. However, if you don't mind a box at least as big, and if not bigger than your micro, then try them. Software, though, is not supported.

BT 20 — standard robust 300/300 baud modem. Cost: £57.44.

BT 2B — standard 1200/75 baud modem. Cost: £57.75.

Maplin Electronics, PO Box 3, Rayleigh, Essex (Tel (0702) 552911).

Maplin also run their own service for catalogue subscribers and provide their own 300/300 baud modem in kit-form for £49.00.

Note: Some modems are sold without British Telecom approval and your BT engineer — unless the modem is acoustic and does not require a jack point — may refuse to install a socket (if you haven't already got one) if there is not a green triangle approval sticker on your hardware.

Confusing

Program *Dix Mille Micro*
Spectrum 48K **Price** £2.99 **Supplier** CCS, 14 Langton Way,
Blackheath, London SE3.

I was surprised to see this game, as it's the first CCS game I've come across at the cheap price of £2.99.

They well may try to maintain their old prices for their old games, but since this is no better or worse than their others it seems a little confusing.

Dix Mille is a very simple gambling game, using dice. Because the instructions were very unclear, though, I spent more time trying to find out how to work the game than I did actually playing it. The game shows reasonable graphic representations of the six dice with which you gamble but after one or two go's, watching them gets rather mo-

notonous, as the screen display rarely changes (only to offer you a new game).

I have been much impressed by some of the other cut-price software around, in particular from Mastertronic and Atlantis, but this program from CCS is not as good — even though it costs £1 more.

One advantage of *Dix Mille* is that, since it is written in Basic and is totally unprotected, you are able to *List* it to see what techniques the programmer has used. That said, the game is very badly written, and with care could almost certainly have been fitted into a 16K

computer — at the moment it is just for the 48K Spectrum.

Sorry CCS, but you'll have to do better than this, even at the low price. It is cheaper to buy any micro magazine such as this where the games listed inside are just as good.

David Lester

Amusing

Program *Wordgram Micro*
BBCB **Price** £9.95 **Supplier** Daco Software, 59 Mackenzie Road, Moseley, Birmingham B11 4EP.

After the cleverness of *Readright* and *Storyline* this latest offering from Daco is a disappointment.

It sets out to help people learn about parts of speech: nouns, verbs, adjectives, conjunctions. Like the others in the series it encourages the user to write little stories so that there is a creative aspect to the exercises. The resulting tale is often amusing. From the start you decide whether to use

formal grammatical names or brief descriptions (eg "nouns" or "words for people and things"). A simple menu at the foot of the screen prompts you to pick a type of word, then offers one of that type. If you accept it it joins the slowly building story at the top of the page. Reject it and another is offered. The finished story can be shown on screen in pages or dumped to a printer.

The snag is that the program cannot do much useful checking of the learner's responses. All you really get practice in is recognising what sort of words are "verbs" or "words for action".

Dave Watterson

Step forward

Program *Moder-80 Micro* 16/48K Spectrum **Price** £6.95 **Supplier** Seven Stars Publishing, 15 Gloucester Avenue, London NW1.

Moder-80 is a machine code disassembler and editor which, together with its companion *Gener-80*, a full assembler, gives very comprehensive facilities for writing, modifying and checking machine-code programs.

It offers all the facilities you would expect from a machine-code de-bugging tool including the ability to display registers, to insert a breakpoint (at which they will be dis-

played) and to single step through a program, again seeing the registers, thus enabling you to discover exactly where (for example) an unintended jump is being made. When an error is found the program can be modified using the simple assembly facilities. Other features include full disassembly of machine code (including the ability to save the disassembled listing to tape for later use with *Gener-80*), Hex arithmetic and hex to decimal conversion, and writing both one and two byte numbers and Ascii strings directly into memory.

The program is compatible with Interface I and can be backed-up to Microdrive.

Simon Springett

Booby traps

Program *Bumpers Micro* Dragon 32 **Price** £7.95 **Supplier** Dragon Data.

Bumpers is a maze game for either two players or for one player against the computer. The opponents start off in the top left and bottom right points of the maze and the winner is the first to navigate to the opponent's start point.

which case the zapped victim reappears at a randomly determined point on the maze.

Each game is itself randomly generated and there is only one correct path through. To add further to the hazards, a player can create up to three booby traps of his or her own at a time during the game and this can be used strategically.

The game can be varied by changing the dimensions of the maze to any size up to a maximum of 13 by 15, and, when playing the computer, 4

There are, as you would hope, some complications. The maze is initially invisible — all that is displayed is a matrix of dots showing the dimensions of the maze and it is only as you touch a wall that a small portion of it appears. Further, dead-ends have one wall booby-trapped and touching that sends you back to the start point. You can zap your opponent when you cross over, in

levels of difficulty are offered. Control is by joystick and since the emphasis is on thinking as much as dexterity, the speed is controlled by the user.

The bleeps from two players in action sounds a bit like massed armies of mice. A simple idea, but good fun nevertheless.

Derrick Trueman

Thrills 'n' spills

Program Full Throttle Micro
Spectrum 48K Price £6.95 **Supplier** Micromega, 230-236 Lavender Hill, London SW11

Full Throttle is the motorbike equivalent of Psion's *Chequered Flag*. A racing game, where you ride a 500cc bike around any of ten of the world's most famous tracks. The screen display is almost identical to that of Psion's highly successful game — the road twisting and turning in front of you, with grass either side, and mountains in the distance.

Although *Chequered Flag* is recognised as the best car racing game available for the Spectrum, it does have two faults. Firstly, you can't use a joystick (at least, no ordinary joystick, such as Kempston); secondly, you have to just race

likely game recently released to cause you to break your joystick — you'll become so engrossed that you'll push it and pull it... then, snap, no more joystick!). And what is more, not only can you race alone, in the 'practice' mode, but you can also race against 40 other bikers.

Racing against the other bikers makes for a much more addictive game. No matter how I tried, I could not do better than finishing 39th out of 40. I actually reached 34th place at one stage in one of the races, but I soon dropped back again. The main reason for my bad performance, is that whenever you hit another bike you are slowed down to 0 mph, and must then accelerate again. Incidentally, acceleration on your bike is rather good — 0 to 175 mph in about 3½ seconds! The problem I had, was that I seemed unpopular — whenever I came up behind a bike and was about to overtake it, it

takes errors in its stride.

The imaginary instruction set includes only the *Load*,

binary form make it easy to see just what is going on as you run, or single-step, your program.

Arithmetical, Logical, Comparative Jump and Halt groups, but nevertheless allows a beginner to make the first steps of machine-code programming. The clear screen display and fairly comprehensive manual, together with the use of decimal values in all registers, and the ability to display output in

Reasonably priced and well presented, this is a good buy for the serious computer user who wants to learn more, but finds the idea of leaping straight into Z80 machine-code a little daunting.

Simon Springett

Serious study

Program Microdrive Utility
Micro Spectrum 48K Price £4.50 **Supplier** Easyuse Software, 67 Arlott Crescent, Oldbrook, Milton Keynes, Bucks MK6 2RA.

One of the gripes about Microdrives is the lack of information given by the Basic command *Cat n* which simply displays the cartridge name, a list of the non-protected file names and the remaining available space on the cartridge. The file types are not listed, nor an indication of any faults that might exist.

The *Microdrive Utility Program* (or *MUP*) from Easyuse Software fills this information gap, with a good range of diagnostic tools to investigate a cartridge. After loading the tape (which you can back up to

microdrive cartridge) you are given a menu of options, including some related to the physical state of the cartridge — such as a sector distribution map — and some related to the individual files — you can see the length and position of each program on the tape, for example, or investigate each sector involved, seeing checksums and the initial information on each sector. A *Copy* facility would have been useful to keep a record of useful information. The program assumes a fair knowledge of the microdrive's data structure, but there are plenty of books available to give that information.

MUP is useful, cheap and, being entirely in machine-code, fast. Well worth £4.50 for anyone with serious uses for their microdrive.

Simon Springett

against yourself. Micromega have taken the same idea for a game, changed it slightly (motorbikes instead of cars), and have remedied both of the faults mentioned above. You can use almost any joystick (be warned — this is the most

moved, or whether I am just paranoid, I do not know. But one day I'll show those other riders just what I can do.

David Lester

Mnemonics

Program Spectrosim Micro
Spectrum 48K Price £5.95 **Supplier** Shiva Software, 4 Church Lane, Nantwich, Cheshire CW5 5RQ.

Assembly language allows you to enter machine-code mnemonics — the abbreviated instructions to the processor at the heart of the computer — and have them automatically

converted into the correct numerical form.

One difficulty of learning Spectrum assembly language is the complexity of the Z80 instruction set, which needs to deal with some twenty registers and eight flags, and the problem that a crash is usually fatal to the program itself.

Spectrosim gives the beginner a chance to learn about assembly programming on an imaginary microprocessor, which has just four registers and three flags, and which

Gamble or collect

Program Jackpot **Price** £4.95
Micro Spectrum Supplier Michael Horgan.

Although there are quite a number of fruit machine simulations on sale for the Spectrum, I have not seen any of them.

So I looked forward to this game to see how the age-old 'arcade' (the old type) game had coped with its transition to a computer.

I cannot honestly say that it has retained any of its addictive qualities. The original was enjoyable — you could see the wheels spinning and this somehow added to the fascination. This version, though, does not show any such moving graphics, even though it would be a marvellous opportunity to exploit the programmer's talent for high quality graphics — the

program certainly needs something to add a bit of life to it. Instead, when you press the S key to start your go, you hear (if you have good hearing) three miserable beeps, and the new fruit, bar, or whatever, appears on the screen. The Spectrum is not the world's noisiest computer, but a game like this really needs better sound effects which are well within reach from either Basic or machine-code.

If you occasionally play a real fruit machine and want to continue the same excitement in the comfort of your own

home without losing pocket-fruits of 10p's you should not buy this game. If you happen to be uncontrollably addicted to the real thing, then this program is likely to provide cure. I have not been so bored since *Mugsy* and *The Fall of Rome* — the two most overrated games to have been released for ages — came on sale.

David Lester

Flashing dots

Program Admiral Graf Spee **Micro** Amstrad CPC 464 **Price** £7.95 **Supplier** Amsoft, Brentwood House, 169 Kings Road, Brentwood, Essex.

Set in the South Atlantic during World War Two, you are Captain Langsdorff at the helm of the German pocket battleship Graf Spee with the objective of seeking out and destroying enemy British ships.

This is quite a good basis for a game but the implementation leaves a lot to be desired. For example searching for enemy ships is simply a matter of

moving the Graf Spee around the screen, using either keypad or a joystick, towards intermittently flashing dots whilst trying to conserve fuel.

Compared to this boring search, the battles are quite exciting. The Graf Spee must be manoeuvred within range and sight of the target before it can be engaged with guns and torpedos. The targets are able to return fire, with great effectiveness.

Problems are the unresponsive controls, a 'Hold' key that fails to work or else destroys the program and generally sluggish action.

Greg Pearson

Challenging

Program Harrier Attack Micro **Commodore 64 Price** £6.95 **Supplier** Durrell Software, Castle Lodge, Castle Green, Taunton, Somerset.

The name of the game tells you what it's all about. You have to pilot your Harrier jump-jet from its base on board an aircraft carrier on a mission to destroy the enemy base.

As you fly over enemy territory you are constantly attacked by hostile aircraft, rockets and ground-to-air missiles. You only have a limited supply of rockets and bombs with which to defend yourself, so you have to be careful to leave sufficient for your assault on your target. Fuel must also be conserved by flying at an economical speed, and avoiding too much manoeuvring. If you reach the base and destroy

it, you must then return to the carrier, flying back the way you came.

The graphics and sound are straightforward but effective. The manoeuvrability of the Harrier is nicely reproduced — you can control motion in vertical and horizontal directions, accelerate, decelerate and fly backwards. In order to control all these functions, plus firing rockets and dropping bombs, you need to be able to operate no fewer than seven keys. However, they are sensibly laid out, and fall readily under the fingertips. Quite challenging.

Richard Corfield

Fifteen-two

Program Crib Micro **Spectrum 48K Price** £5.95 **Supplier** Mutch of Farm Cottage, 28 The Street, Barton Mills, Bury St Edmunds, Suffolk.

Card games don't always transfer very well to a computer but the Farm Cottage version of *Cribbage* is an exception well worth considering if you would like a game and don't have a partner to join you.

The program is an accurate implementation of the original, though plays only the two-player version, with the computer taking the part of one of the players. You play twice round the board, and the human player is given the first

crib, or extra hand (though experienced players will know that this may not help especially: who has the crib may be more important at the end of the game).

Crib blends Basic and machine-code, and uses colour and sound well. You are always able to study the game before deciding on your move. All entry is by single key-press and prompts make the game easy to play. My one criticism was that during the pegging section the running total was not displayed, nor prompts of suitable values to get 31 given (such as "26: five's a fix" and "30: one for two"), but don't let this put you off buying.

An obvious answer

SuperBasic has many of the powerful features of Pascal including recursive techniques. Alan Turnbull takes a look

One of the most interesting and useful features of the QL for me is its structured programming.

I have been used to programming in Pascal for several years, but now I can get most same features in QL SuperBasic — although the data structuring facilities of Pascal are not available on the QL.

As well as structured loops, the programmer can construct procedures and functions, totally transparent in purpose to the user — just as in Pascal, and use them as if they were part of the SuperBasic language.

A special class of procedures and functions — referred to as 'recursive' — are of particular interest to programmers. A recursive object is one which is defined partially in terms of itself. Recursion is not the same as one of those 'circular' arguments you start in the pub when you have had one too many! In describing an object recursively, we begin by describing a simple case directly. Solutions to others more complicated are then found in terms of the solution to the simple case.

Unfortunately, early programmers, especially Cobol programmers in the 1960's, looked upon recursion as an ivory tower plaything and ignored it. But recursion, if used wisely, can give the most obvious solution to a complex problem.

Consider the mathematical definition of a factorial. The factorial of n written as $n!$, is defined as the product of all integers from n down to 1. For example $6! = 6 \times 5 \times 4 \times 3 \times 2 \times 1$. There is also a special, so-called 'base case', $0! = 1$, which is defined to be true.

From this a recursive definition of factorial can be formed. $\text{Factorial}(0) = 1$ and $\text{factorial}(n) = n \times \text{factorial}(n-1)$. A SuperBasic function can be written directly from this definition — it is shown in Fig. 1. Note that the SuperBasic definition looks just like the mathematical definition.

```
100 REMARK Factorial function for
    the Sinclair QL
110 REMARK July 1984, Alan
    Turnbull
120
130 DEFINE FUNCTION FACTORIAL(n)
140 IF n=0 THEN
150 RETURN 1
160 ELSE
170 RETURN n*FACTORIAL(n-1)
180 END DEFINE FACTORIAL
```

Fig 1

From this start with an easy and well-known example, one can progress quite a long way. Strictly for the mathematicians among you a function exists called Ackermann's Function which is used mostly to illustrate recursion to students! It may be summarised as follows:

$\text{ack}(0, n) = n + 1$

```
ack(m,0) = ack(m-1,1)
ack(m,n) = ack(m-1,ack(m,n-1))
for m,n >= 0.
```

Fig. 2 shows a SuperBasic listing to implement this function. Just try to implement it in Basic on the ZX Spectrum! Indeed, the only way to do it would be to explicitly use a stack and even then, problems of variable clashes would arise.

```
100 REMARK Ackermann's Function
    for the Sinclair QL
110 REMARK 1984, Alan Turnbull
120
130 DEFINE FUNCTION ACK(m,n)
140 IF m=0 THEN
150 RETURN n+1
160 ELSE
170 IF m<0 AND m>0 THEN
180 RETURN ACK(m-1,1)
190 ELSE
200 RETURN ACK(m-1,ACK(m,n-1))
210 END IF
220 END DEFINE ACK
```

Fig 2

Onto procedures and Fig. 3 shows a SuperBasic procedure to sort a numerical array. So what?, you may say. Well, this sorting algorithm is different from the ones you will be used to. For a start, it is not the good old 'bubble sort', which is thrashed out in many articles and secondary school computer studies courses.

```
100 REMARK QUICKSORT algorithm for
    the Sinclair QL
110 REMARK July 1984, Alan Turnbull
120
130 DEFINE PROCEDURE QUICKSORT
    (array, left, right)
140 LOCAL i,j,median,temp
150 IF left<right THEN
160 LET i=left:LET j=right
170 LET median=array((left+right)
    DIV 2)
180 REPEAT main_loop
190 REPEAT expand_s1
200 IF array(i)>median THEN
    EXIT expand_s1
    LET i=i+1
210
220 END REPEAT expand_s1
230 REPEAT expand_s3
```

```
BEGIN
IF s contains more than one element THEN
BEGIN
choose the median element x from s,
partition s into sequences s1, s2 and s3
with elements
less than or equal to x, equal to x and
greater than or equal to x;
quicksort(s1);
quicksort(s3)
END
END
```

To call the procedure, you should state its name in a SuperBasic statement, with three parameters: the array you wish to sort, the lower bound of the array and the upper bound. A typical call to sort an array dimensioned as DIMENSION array_1(100) would be quicksort array_1,1,100

In Fig. 3, note that LET statements are used throughout. SuperBasic defines the keyword LET to be optional but I have left it in to aid clarity. The Pascal Repeat/Until and While/DO loops are both replaced in SuperBasic by the REPEAT/Exit/END REPEAT construct.

It is easy to see that the While and Repeat constructs in Pascal, and the REPEAT construct in SuperBasic compare in the following manner:

WHILE (condition) DO	REPEAT (loopname)
BEGIN	IF NOT (condition)
statements	THEN EXIT (loopname)
END;	statements
	END REPEAT (loopname)
REPEAT	REPEAT (loopname)
statements	statements
UNTIL (condition);	IF (condition) THEN
	EXIT (loopname)
	END REPEAT (loopname)

```
240 IF array(j)<median THEN
250 EXIT expand_s3
260 LET j=j-1
270 END REPEAT expand_s3
280 IF i<j THEN
290 LET temp=array(i)
300 LET array(i)=array(j)
310 LET array(j)=temp
320 LET i=i+1
330 LET j=j-1
340 END IF
350 IF i>j THEN EXIT main_loop
360 END REPEAT main_loop
370 IF left<j THEN QUICKSORT
    array, left, j
380 IF i<right THEN QUICKSORT
    array, i, right
390 END IF
390 END DEFINE QUICKSORT
```

Fig 3

It is 'Quicksort', developed way back in 1962 by Professor Tony Hoare at Oxford University. Why have you not heard much about it, then? The answer lies in the fact that a good many Basic dialects cannot support the concept of recursive procedures and functions, and local variables. BBC Basic can, and so too can Sinclair QL SuperBasic. So the six-month wait was worth it, after all!

The algorithm may be summarised in English as follows:

PROCEDURE quicksort(s)

Note that the Quicksort algorithm is very fast (subject, of course, to the speed of the system it runs on) and that it may be used as a direct command or as a program statement. This could perhaps, be a procedure you may wish to place in a file called Boot, on MDV_1, so that upon the QL bootstrapping, it loads the procedure into memory ready to be used. This way, one could develop a QL turn-key system!

I hope this article proves to be a good introduction for readers to the concept of recursion in programming.

APOLOGY

Cheetah Marketing Ltd. sincerely apologise for developing their latest computer peripheral. This will have the effect that your existing joystick is just about to be completely outdated.

However, on August 22nd you will be able to experience the evolution of the most sophisticated computer peripheral ever developed.

The age of the R.A.T. is dawning.

Cheetah Marketing Ltd. 24 Ray Street,
London EC1R 3D1. Tel: 01 833 4909
Telex: 8954958

ATTENTION! ATTENTION! ALL COMMODORE USERS!

Do you use tapes? Are you sick and tired of waiting for your programs to be Loaded/Saved from/on the tape? Then you need a **TORNADO!!** Tornado allows you to Save/Load/Verify your Basic/machine code programs faster than a CBM 1541 disk drive does!! Due to popular demand! Tornado now comes with new and more powerful commands plus extra instructions to assist you in making fast versions of your existing machine code/Basic programs. Tornado is available on tape for CBM 64 and 8K + Vic 20.

Do your Run/Stop and Restore keys often fail? Do you want to come out of those crashes?! Or get into those unbreakable programs?! Then what are you waiting for, get yourself a **BREAKER!!** Available for CBM 64 and the Vic 20 now is the **ROM-FILE** which contains a complete disassembly of CBM 64/Vic 20 Rom with comments! As well as a complete description of all 6502/6510 instructions and addressing modes + a complete listing of a machine code monitor and more!

Please make cheques/PO payable to:

BSF COMPUTER SERVICES LTD.
DEALERS AND GENERAL ENQUIRIES
TEL: 079882240

Please send me.....Tornado at £9.95 + my free Breaker

Please send me.....Rom-File at £7.95

I enclose cheque/PO/cash to the sum of £.....

Name.....Computer

Address.....

Please use this form and block letters only. All prices are inclusive of p&p (mail order only, add £2 if outside UK). Please post to:

BSF CSL, 20-28 BOLSOVER STREET, LONDON W1.

WIN THE POOLS???

48k

SPECTADRAW 3 - THE LATEST VERSION OF THE ORIGINAL AND BEST POOLS PREDICTION PROGRAM FOR THE 48K SPECTRUM!!

"The most user friendly of the programs reviewed, making full use of the Spectrum's colour facilities... better than my own methods or the national newspapers" - *Personal Computer World* March 1984

- * SUPPLIED WITH A DATABASE TAPE CONTAINING DATA ON OVER 1000 MATCHES SINCE 1980
- * DATABASE UPDATED EACH WEEK BY USER. BUT NO TEDIOUS TYPING AS THE TEAM AND DIVISION NAMES ARE ALREADY IN THE PROGRAM
- * ERRORS CAN EASILY BE CORRECTED - THE PROGRAM EVEN CHECKS YOUR ENTRIES!
- * COMPREHENSIVE INSTRUCTION MANUAL AND MENU DRIVEN PROGRAM - EVEN A NEWCOMER TO COMPUTING CAN EASILY USE SPECTADRAW 3!
- * WILL FORECAST THE LEAST LIKELY DRAWS FOR THOSE WHO PREFER TO BET ON FIXED ODDS!
- * NOW INCLUDES SPECTASORT - THE FERM GENERATION PROGRAM THAT TAKES SPECTADRAW'S PREDICTIONS AND TURNS THEM INTO A FERM. COMPLETE YOUR COUPON DIRECT FROM THE SCREEN!
- * FULLY MICRODRIVE COMPATIBLE - LOADS AND SAVES THE DATA FROM YOUR MICRODRIVE IN SECONDS!
- * COMPATIBLE WITH THE CURRAH MICROSPEECH SYNTHESIZER - THE FIRST POOLS PREDICTION PROGRAM THAT WILL READ YOU ITS PREDICTIONS (NB THIS FACILITY WILL ONLY WORK IF YOU HAVE A CURRAH MICROSPEECH UNIT CONNECTED TO YOUR COMPUTER)
- * THE INTERNATIONALLY POPULAR POOLS PREDICTION PROGRAM (NOW IN USE IN 14 DIFFERENT COUNTRIES) STILL AT THE UNEARTHLY PRICE OF £9.95 INCLUSIVE (CHEQUES/P.O.s PAYABLE TO B.S. McALLEY)
- (WE DISPATCH EVERY MONDAY DURING THE FOOTBALL SEASON WITH THE DATABASE MADE UP TO INCLUDE ALL MATCHES TO THE DATE OF DISPATCH)

SPECTADRAW (Dept PCWK) 1 COWLEAZE, CHINNOR, OXFORD OX9 4TD (TEL: 0844-52426)

PROGRAMMERS £1,000 REWARD!

We are offering a prize of £1,000 for the best arcade game program submitted to us by August 31, 1984 for either the 48K Spectrum, Commodore 64 or Amstrad. The program must be your own copyright which will be assigned to us on presentation of the award. The winner will also receive royalties based on our normal, escalating royalty package, for all copies of the program sold for any home computer. To enter, submit a copy of the program together with full operating instructions to:

R M Summers
STERLING SOFTWARE

Garfield House
86-88 Edgware Road
London W2 2YW

The decision of the publishers will be final and the name of the winner will be announced in the computer press.

Sterling Software is a division of Sterling Publications Limited.

Character forming

Create any characters of your choice with Mark Gornell's character generator program

The program lets you create a character of your choice, but it is quicker, easier and simpler than using pen and paper as it would normally have done. You control a cursor on an eight by eight grid and plotting points on the grid forms the character.

When you have finished using the grid the space bar is pushed, the program then displays your newly formed character and the data that created it. If you are not happy with the character, just go back to the grid and try again. Once you set the character you want you can write down the data and use it in your own programs! If you do not fully understand programmable characters then I suggest you read the Programmer's Reference Guide, pages 107 to 114.

When you have created a character on the grid you should position the grid's cur-

sor over a plotted point before pressing the space bar, this is just so the computer won't count the cursor as a plotted point.

There is an automatic erase built into the cursor, so when you plot a point and move back across it you will erase it. When the cursor is on top of a plotted point that you want to keep, just press the key to plot before you move again.

The advantages of using the program are that you can make many more characters than the ones found on the keyboards, these may range from digital lettering to roman numerals.

The character set is moved from Rom to Ram at the beginning of the program because the characters can only be changed once they are in the Ram, as the Rom characters always stay the same.

Keys

D-Moves cursor left
A-Moves cursor right
W-Moves cursor up
X-Moves cursor down
S-Plots a point on the grid
Z-Clears the whole grid

Abbreviations

[CLR]-Shift clr/home
[CBM4]-Commodore key and 4
[CUR]-Cursor right
[CUD]-Cursor down

Program notes

50-60 Set up screen
70-130 Move character set
135 Set variables
140-280 Set up screen
290-350 Check key pressed
370-400 Calculate data
420 Create new character
455-550 Print character and data
5000-8040 Draw grid
6000-6060 Check move

Catalogue of errors

Alan McDonald explains the error table in Part 3 of his adventure series

This week we shall be doing the following:

- 1) Expanding the error table.
- 2) Dealing with movement, eg, *Go North* and
- 3) Taking a look at how the *Get*, *Drop* and inventory routines work.

The Error Table

If you examine this week's assembler listing, you should see a section headed the Error Table. In fact, it isn't an error table, but instead a quick way of printing messages, such as 'Ok...' or 'I don't understand'. Messages are printed to the screen:

```
LD B, message no.
CALL PRINT
JP INPUT
```

As you can see, using the above format is not always desirable. Obviously the message 'Ok...' is used a great deal in adventures, and to keep on using the above format for printing messages uses up a great deal of unnecessary memory. The following is much easier.

```
JP_OUT CALL PRINT ; call the print routine
JP_IN PUT ; jump to the input routine.
```

Movement

Movement is very easy to control. We used six variables to store the directions which can be moved to, from the player's current location, ie NOR, SOU, EAS, WES, UP, DOW. Remember 0 = 'You can't go in that direction.' As an example, say the player wanted to move North:

- 1) Test the value held in the variable NOR
- 2) If it's 0 then print 'You can't go in that direction.'
- 3) put the value in NOR into X
- 4) Jump to the PLOC routine. (Print location.)

In machine code that's:

```
G.NOR LD A, (NOR) ; A holds the value in NOR.
CP 0 ; is it 0?
JP Z,ERR_4 ; if yes print 'You can't go in that direction.'
LD HL, NOR ; HL points to NOR
LD A, (HL) ; now A holds its value.
LD (X), A ; put it into X
```

Get and Drop

Take a look at this week's assembly listing and you should see two tables called get and drop. You should however ignore these as they deal with the get and drop all routines.

Imagine the player typed *Get Cage*. Once the computer has found the word *Get* it calls the *Getit* subroutine. Once the *Getit* routine is entered, checks need to be taken to see what object the player wants to take or drop. The routine to do this is called *Test2*, each object is tested in turn. The *Test2*

routine also checks for 'ALL'.

Once an object has been identified, the C register is given a value which corresponds to the object. Take a look at the first part of the series; remember the keys are object 1. Therefore if we entered *Get Keys*, the computer would load the C register with 1. However, sometimes two objects are used to represent only one object, eg:

A TORCH WHICH IS OFF

and

A TORCH WHICH IS ON.

Remember that only one object can exist at any one time. Therefore, if the existence of one of the torches is 3 (does not exist) then C is loaded with the object number of the other torch, ie:

```
T2 DEFM "TORC"
NEXT2 LD HL, T2 ; is it the torch?
CALL FIVE
JP NZ, NEXT3 ; if no check next object.
LD HL, EXE+1 ; the torch which is on.
; (object 2)
LD A, 3
CP (HL) ; does it exist.
JR Z, O.TOR ; if no then it must be the other torch
LD C, 2 ; C = the torch which is on.
JP FINISH ; exit test routine.
LD C, 3 ; C = the torch which is off.
JP FINISH ; exit the routine.
```

We now know the object's number (it's held in the C register.) Before it can be picked up, several questions need to be answered,

- 1) Is it at the same location as the player?
- 2) Can it be picked up; ie, is its existence 0.
- 3) Can the player carry any more objects?

This is done by checking the variable INV, if its value is greater than four, then no more objects can be carried. You can change this to any value you require. Note: you will need to change the CP 4 in the GET (get all) routine as well. The get all routine simply works by testing all of the objects in turn. Also note the routine labelled *DISS*, simply prints the object to the screen; ie:

YOU TAKE:

The torch which is off.

The variables NT and ROU are used by the *DISS* routine.

The Inventory Routine

The inventory routine simply checks to see if you are carrying an object. If you are, then it's printed to the screen. This can easily be done by testing the existence of each object, ie, seeing if it's 1.

However, you should note that the inventory routine which I have written also checks to see if you are wearing an object, ie, if the existence is 4. If you are going to use this facility in your own adventure then

you must change the value into line 8000.

If message 10 in your program is - (which you are wearing.) Then change the line into LD B, 10.

Note: the inventory routine first checks to see if you are carrying anything with you. If you are not then the computer will display:

You are carrying nothing with you.

Note: As with all the routines which deal with the objects, you will need to tell the computer how many objects your adventure has; ie, change all the 14's to what ever value you have, and all of the 15's to the value you have + 1.

Next week sees the final part in this series of adventure writing.

TURBO CHARGE YOUR SPECTRUM

Outperforms any Spectrum interface

The unique Turbo interface from Ram gives you all these features – and more – in one unit:

- * A variety of interfaces including: Rom cartridges, two 9-way D plugs for standard joysticks, PLUS full expansion bus at rear.
- * Compatible with Kempston and Protek protocols.
- * Works with latest Quickshot Mk II auto rapid-fire joysticks!
- * Choice of Rom cartridge or tape cassette software.
- * Instant program loading with cartridge software.
- * Built-in power safety device – unique to Ram Turbo.
- * Full one year guarantee.
- * Immediate availability – 24 Hr despatch on receipt of P.O./credit card details (cheques – seven days).
- * Incredible value – only £22.95.

So don't wait around – simply complete the coupon and send it to us today.

Or call our credit card hot line on 02514 25252. (Access and Visa welcome).

Ram Electronics (Fleet) Ltd, 106 Fleet Road, Fleet, Hampshire GU13 8PA.

Please send me:

_____ Spectrum Turbo Interface(s) at £22.95
+ £1 p + p (overseas orders £3 p + p)

_____ Quickshot II Joystick(s) at £9.95
(Only when purchased with Turbo – normally £12.95 + £1 p + p)

I enclose cheque/postal order or charge my Access/Visa for: £ _____

Buildings in motion

Jason Orbaum and Geoffrey Campbell continue their series on assembly programming

This week all is revealed about "scroll buildings" routine. The first eight lines (up to the line before FPAST) find the distance of the plane from the ground, as it would hardly be fair to scroll the buildings to above the plane (quite interesting to play though!). The result is placed in *Line*, and is used to load the X and Y registers at FPAST.

This is done by loading them with the addresses for the top and second-top rows respectively, and then taking 32 from them for the number of times held in the A register.

The last part of the routine is a fairly standard block-copy, where the original address is held in the X register, and the target address is held in the Y register.

SUBROUTINES

The first of these (PAUSE) generates a random pause the length of which is

dependent on the contents of the timer (stored at \$1513). It is used to allow the contents of the timer to change between buildings, so that they are of different heights. Without this pause, all the buildings are the same height.

The next routine (BANG) generates the sound when the buildings are put up, and also when the plane crashes. Dragon sound will be covered in two weeks time, with a routine to give a sound of any pitch and duration.

INV is a routine to invert the contents of the screen, when the plane crashes. This will change any block to one of a different character, except the black blocks, which are compensated for by replacing them with a green space. This is, in turn, compensated by the next routine, GREEN, which replaces all green blocks with black ones. This, unfortunately, loses all the green

buildings on the screen, but this does not matter much as it is at the end of the game.

HUMM is more sound, which produces the background noise.

NOPRES is only executed when there is no bomb dropping, and was covered last week.

At the end of each wave, control is passed to FIN, which prints up the score (in another subroutine), pauses and makes a sound by calling ZAP 40 times. It changes the delay variable in WAVE, and then starts again from BEGIN.

ZAP is another sound routine, and SCR prints up the score. This is done in a fairly devious way. First of all, six zeroes are printed on the screen, and then, using a counter held in score, the first digit is incremented that number of times. Each time it is incremented, the character is compared with the colon (first character after the nine) to check for an overflow. If an overflow has occurred, then the program moves on to the next digit, and does the same.

The only drawback with this method is that it will move past the sixth digit and onto the screen display proper (but we have yet

THIS IS THE BIG ONE!

The 2nd Official Acorn User Exhibition

OLYMPIA AUGUST 1984

Thursday 16th – 10am to 7pm

Friday 17th – 10am to 6pm

Saturday 18th – 10am to 6pm

Sunday 19th – 10am to 5pm

* Please note 10am to 2pm on Thursday 16th
is Trade Morning – By invitation only.

BIG VALUE

The success story of Acorn Computers, the BBC Micro and Electron is mirrored by suppliers who have produced more and more hardware, software, supplies and services. And they'll all be at the exhibition – disk drives, plotters, printers, monitors, joysticks, robots, books and magazines, all kinds of software – everything for the Acorn owner.

And of course Acorn will be there in force with all their latest developments and software.

There'll be special offers, competitions, advice centres and special events as well.

And all this for only £3.00 at the door, under sixteens £2.00. (Use the coupon to beat the queues and save £1.00).

BIG VENUE

Olympia 2 is the brand new exhibition centre next to the old Olympia. It's got everything, wide gangways, lots of space to sit down and rest, plenty of catering areas.

Getting there is easy too, it's got its own tube station, bus routes 9, 27, 28, 33, 49, 73 and 91 go right past the door, and there's car parking too!

BIG SUPPORT

Remember this is the *Official* Acorn User Show, it's the most informative prestigious and influential user show in the country. Whether you're a businessman, serious user or games enthusiast there's something for you.

For details of exhibition stands and advance ticket sales contact the organisers.

Computer Marketplace (Exhibitions) Ltd. A Rushworth Dales Group Company, 20 Orange Street, London.
WC2H 7ED Tel: 01-930 1612

BEAT THE QUEUES! SAVE MONEY! ORDER YOUR TICKET IN ADVANCE.

Buy your ticket now and save queuing. There will be special entrances for advance ticket holders.

Please send me _____ (qty) tickets at £2.00 and _____ (qty) under sixteen tickets at £1.00. I enclose my cheque/PO
to the value of £_____ or debit my Access card. No. _____

Try out your airbrush technique with Paintbox — a graphics program by Christopher Bowerman

Computer generated art is a fascinating, rewarding area for computer users to explore. However, the graphics commands of the BBC micro and the ways in which they interact are far too complex to be able to readily predict the resultant effect.

Paintbox, although not the most sophisticated of graphics programs, overcomes this problem by providing an environment comprehensible to the novice, yet providing more sophisticated features for those wishing to delve deeper into the system. To this end I have endeavoured to make the system as user friendly as possible, but, as I was determined that the program should run on a model A, some of the prompts do tend to be rather mnemonic.

The main features are: painting with either an airbrush or a paintbrush, line drawing, polygons, area-fill, four paint colours and Saving to and Loading from tape. The main options are available via function and other keys without having to answer any prompts.

The program comes in two halves, the first of which Chains the second, after having set up the function keys, set Page to a suitable level, and having instructed the user on the use of the system. The second program is the main one and should be typed exactly as it is written (for model A machines). Model B users could change MODE5 to MODE1 and gain the benefits of a higher resolution.

As is often the case with computers, there can be no substitute for "hands-on" experience and the following presumes that you are trying things out as they are detailed. The Break key has been defined to exit the program without corrupting the program.

When the program runs the start prompt "Set up Y/N/Q/L/S" appears. To set up a particular background, mode of plot, start position, brush size paint density, hit Y. Pressing N makes the computer set up these values. Q will quit the program. L loads a picture from tape and S saves the current screen to tape. When saving, the usual Record, then Return prompt will be displayed, but press Return twice so that a set of data will be recorded immediately after the picture. The data saves the background colour so that alterations can be made on subsequent loadings. Hitting Escape at any time will return you to the start prompt.

The cursor should now be flashing in the centre of the screen. It is moved by the following set of keys QWEASDZX (Fig.1) which are arranged like the points of a compass. W=up, D=right, S=paint in same area, X=down, etc. Diagonals QEZX are also available. Move the cursor to a suitable

position. Now select a colour, function keys 0 to 3, and move the cursor; you will be in paintbrush mode. Colour can be changed (Fig.2) by pressing function key 4 at any time.

To change from brush to airbrush hit function key 4, and move the cursor. Pressing key 4 again will change back to paintbrush. To move without erasing, select the key for background colour (black or key 3, in this instance) and move to a new position, then select a new colour and move off again. If you make a mistake you can clear the whole screen with Ctrl C.

Alternatively, you could erase with the cursor. First select background colour (erasing only works in background colour), then press function key 6 to turn erasing on, move the cursor over the mistake and it will be erased. Now hit key 6 again to turn erasing off, so that you don't erase accidentally next time background colour is selected! Now choose a fresh colour and move off again.

Next line drawing. Lines are drawn from the current position, in the currently selected colour — so ensure they are set as desired before hitting T R or L. Press T to trace a line. A dot will mark the start position, move the cursor to the end position and press Return — a line is drawn between the two points.

If you wish to draw a line from the start position of the last line drawn press R (repeat line), move to the end position and hit Return. Repeat line can be called ad infinitum, and was used in drawing the sun in the sample picture.

Hitting I (increment) is useful for grid drawing, etc, but first let's clear the mess we've created, by pressing control C. First trace a line to the right with the T option. Now move, in background colour, a few places directly upwards, then re-select the paint colour and press I. Now tap the space bar a few times and Return to finish. Then hit R, to draw from the end of the last line, and move upwards to the top of the lines you just drew and press Return. In background colour, move directly right a few places, select a new paint colour and hit I. Then tap the space bar a few times and a grid should be completed.

By diagonally offsetting the second point all sorts of slanting, warped grids can be produced. This was used to produce the ladder and to make the sun stripy. One more thing; lines can be either dotted or solid (Acorn's descriptions not mine). To select dotted lines, press key 5, hitting this again will revert to solid lines.

Polygons are selected by pressing P. A prompt "Fill/Wire" will appear, F will give coloured-in polygons and W gives outline polygons. The next prompt "sides/R" re-

quires the number of sides and the radius of the polygon (separated by a comma) to be entered. The polygon will now be drawn in the currently selected colour at the current cursor position.

However, there are, as always, other facilities allowing polygons to be drawn in perspective — this also provides ellipses; eg, the cone and dustbin. Clear the screen again and hit key 7, now draw a Filled polygon, with 20 sides and a radius of 100. An ellipse is drawn; ie, a circle in "perspective". Pressing key 7 made the polygon routine take note of the height-width ratio set by key 8.

Normally horizontal polygons will be drawn, but if key 8 is pressed and you again key in the information for a filled, 20 sided polygon, then vertical ellipses result. If key 7 is hit again, the polygon routine will ignore the horizontal/vertical setting of key 8 and normal, full view polygons are drawn.

To change the size of the brush, press L (levels) and the prompt "area, density" appears. Two numbers separated by a comma should be entered. Area controls the size of the brush or airbrush and density controls the number of dots within that area (airbrush mode only). Any numbers can be used for these parameters, but 1 to 10 are designed to give reasonable results.

To move the cursor to a specific (x,y) co-ordinate, hit M, key in the x and y co-ordinates as two numbers separated by a comma and press Return.

Graphics background and mode of plot may be changed by hitting (Fig.3) G. In reply to "Bgnd Col Mix Wipe" press either C, M, W, or S to keep the same parameter as last time and Return. C is ordinary plotting (CGOLQ,x), M is OR plotting (CGOLL,x), and W is AND plotting (CGOL2,x). The normal option is C, but M can be useful as it mixes with the colours already there. W also allows mistakes to be erased or particular colours.

If you are familiar with the CGOL parameters 0 to 4, these can be entered (as numbers) instead, and, even if you're not, entering a number greater than 4 will give striped colours and access to shades. The background colour is the next prompt to appear, simply hit an fkey (function key) from 0 to 3 — they represent their usual colours — and Return. The next prompt asks for the foreground mode of plot and this works in the same way as for the background mode of plot; ie, C M and W have the same function and numbers can be entered if preferred — try a number greater than 4!

If you wish to default to the last known parameter on the L (area/density) or G (colours) options press S for Same, and they will not be changed.

The final facility available, used to make most of the street scene picture, is triangle area-fill. This fills in a triangle in the current paint between the next three points visited. To use this hit function key 9; your present

position is the first point and a dot is left as a reference. Now move the cursor to the second point and hit **Return**, then move to the third point and press **Return**—the area will be filled in.

When using the **T** (trace) and **R** (repeat) options, don't hold the key down for too long because the auto-repeat of the key will cause an error and this may, on model A's, be "fatal".

Model A owners should type lines 310 and 330 as below to account for the lower address of screen memory:
310 *SAVE P L80 3FFF
330 *LOAD ... L80

Mean

on Vic20

This is an interactive program to calculate the Mean, Sd and Variance of a set of numbers. The program runs on an unexpanded machine. It can be amended for higher memory capacities by altering the Dim() in line 50 and the Z upper limits in 80 and 85.

Variables

Z=DDATA ITEM NUMBERS:SS=SUM

REGISTER: a () = DATA
ARRAY:B()=FREQUENCY ARRAY
P=N DATA: Q=TOTAL DATA: L=DATA
SQUARED
S=UPPER PART OF THE STANDARD DE-
VIATION FORMULA (L=PX(Q/P)X(Q/P)
D=S/P(P-1): SD=SQUARE ROOT OF D

The program calculates the following variables: mean; sum of scores; sum of squares; mean squared; stand deviation (N-1): standard deviation (N): variance. These can be then inserted into other mathematical/statistical formulae.

Program notes

Lines 30-60 Set up screen and give instruction.
Lines 70-220 Prompt for input of data and test for limits.
Lines 1040-1070 Calculate the total of the data and the total of data squared.
Lines 1000 Tests for division by zero.
Lines 1140-1606 Calculate the mean and SD and variance for N or N-1.
Lines 1610-1620 Return to the mean section on demand or terminate.
Line 90 is twenty 'shift' + '+'; other lines contain 'reverse' or colour change which can be omitted or altered as desired for conversion.

Draw

on Spectrum

This is a short but effective drawing routine for the Spectrum which allows you to draw pictures in different colours on the screen.

Z Left 0-7 Colours
X Right 8 Change Colours
P Up 9 Draw Circle

L Down

Program notes

30-80 Main Loop, after the screen has been drawn by 20. Checks what key is being pressed.
7000-7130 Draws Screen, prints possible colours sales ink to black and cursor to middle.
9000-9020 Inputs new colour, rubs out

9990-9993

Variables

X
Y
ink
rad

input, returns.

Radius of circle, draws circle, rubs out input.

X Coordinate
Y Coordinate
ink colour
Distance of radius of circle.

Input and output

New from Number One Systems of 9A Crown Street, St Ives, Huntingdon, Cambridgeshire, comes an electronics circuit computer aided design (CAD) program for the Spectrum, BBC B and Newbrain computers. It must be stressed that this is a serious program designed for people who wish to test a proposed circuit on the computer without the need to set the circuit up.

With this program, there is no need to actually solder

anything. All one needs to do is to come up with the idea of a circuit on paper and, using the extensive instructions provided with the package, transfer the circuit to the computer. Once details of the circuit are in the machine, then the behaviour of the circuit will be simulated and can be analysed for input and output impedance, and gain, both magnitude and phase at any frequency both linearly or logarithmically spaced.

If you don't know what I'm talking about, then the program is probably not for you. If designing and testing circuits are exactly what you want to do with your machine, then read on. The program will simulate the behaviour of resistors, capacitors, inductors, transformers and both field effect transistors and the common or garden bipolar transistor. The

ac performance of circuits containing up to 60 of these components situated around up to 16 nodes can be evaluated over a large frequency range without even the need to have the components concerned.

The sort of circuit that the program takes in its stride are filters, audio and wideband amplifiers, radio frequency amplifiers, linear integrated circuits and many more. An interesting feature is the program's ability to deal with operational amplifiers as integrated components in themselves. This opens up a wide range of possibilities as you can imagine.

It does not incorporate graphics which are memory hungry, but it has the facility to store circuits on tape and any circuits that do not measure up to expectations can have their parameters changed as well as

any components. A serious program with a serious price, it costs £35.

I hope to demonstrate the use of the program in a future Microradio, but until then any further information can be obtained by writing to the above address or by contacting Adrian Espin or Martin Morris at Number One Systems, on 0480 61778. As far as radio computing enthusiasts are concerned, I should add that the program will deal with frequencies between 0.01 Herz and 1.1 GigaHerz.

Ray Berry GW6JJN

This series of articles is designed for radio and microcomputer enthusiasts alike. If you have any queries that you want answered, hints and tips to share, or topics that you would like to see covered, write to: Ray Berry, Microradio, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Eerie green landscape

Software companies are all hurriedly climbing into their tanks and lining up to take pot shots at each other across 'an eerie green landscape of pyramids and squares'.

After a thousand and one versions of *Pengo* they finally seem to have turned their hands to producing *Battlezone* clones.

For the Spectrum there have long been two very respectable versions namely Arctic's *3D Combat Zone* and Crystal's *Rommel's Revenge*. Although I think the graphics of the latter are better (if you like the wire frame effect of the arcade original) it is a matter of personal choice which game is regarded as more playable. However, there is now a new release, *3D Tank Duel* from a new company called Real Time which is faster than both the earlier games and extremely playable. It uses a slightly different approach to the landscape graphics but is an exciting program and worth a look for those of you who haven't already bought one of the others.

3D Tank Battle for the BBC from Dynabyte at first sight appears superb. Not surprisingly the Beeb's graphics allow a better

attempt at vector graphics than the Spectrum can manage and this looks a lot like the original game. Unfortunately you are only allowed to be in charge of a gun emplacement and not a tank, so you cannot manoeuvre to chase or hide. It is a perfect example of how to turn a tense game involving strategy into a bland shoot 'em up. I hope the company aren't discouraged if sales of the game prove less than they hoped because the BBC badly needs some original programming talent to stretch its abilities and match the progress made with

Vector graphics

the Commodore and Spectrum.

However, when writing a game it is as important to pay attention to what makes a game addictive as it is to produce good graphics. To prove the point *Encounter* from the American company Novogen for the Commodore and Atari machines is a *Battlezone* version that has received rave reviews over there even though its graphics are rather block-like (they seem to have

abandoned any attempt at vector graphics with the resolution possible on a home micro). Yet the game is outstanding because it is what *Battlezone* should be, very fast and very exciting.

Whilst on the subject of arcade copies if you want a really good version of *Zaxxon* for the BBC then run out and buy *Fortress* by Amcom. This easily matches the "official version" sold for the Atari in this country by Centresoft, and shouldn't be missed.

Alligata have released *Loco* for the Commodore which is an arcade copy even though the original game never really took off and will not be familiar to most people. It involves "shooting down" various airplanes and the like by firing steam from your locomotive before they can blow you up. The graphics and sound are excellent.

Finally, *Moon Alert* from Ocean is one of their best releases to date and was well worth the extremely long wait since the adverts first appeared. This company gets better and better and have produced without doubt the best version of *Moon Buggy* for the landscape jumping over craters and rocks and shooting upwards at a collection of motley aliens.

Tony Kendle

Assimilate. And Stimulate.

From Sunshine, a book all about simulation techniques on Sinclair's new QL, written with the unique benefit of actual QL experience. Many entertaining, intriguing chapters explain how you can get your QL to output what you need, to help your hobby, your business – or your curiosity. Inside, you'll find how to develop the ability to fully analyse problems and confidently develop your own simulations. And you'll be able to stretch the potential of your new QL to the limits.

Using our modelling techniques you can create an economic model, or a flight simulator. You can engineer a more efficient engine, or manage a project better. All on your QL, with the help of this vital new book, *An Introduction to Simulation Techniques on the Sinclair QL*.

Order today, using the coupon or from your local bookshop or computer dealer.

Please send me the *Introduction to Simulation Techniques on the Sinclair QL* at £6.95 ISBN 0 946408 45 9.

COURSEWINNER

The Punters Computer Program

COURSEWINNER allows you to use the power of your computer to get the edge on the bookmaker.

● COURSEWINNER contains a database (full of detailed information) on all English and Scottish flat courses. The ten leading jockeys and trainers, and effect of the draw is detailed for each course.

This information can be displayed on the screen at any time.

● The program analyses these factors combined with the results of the last three outings, starting price and weight carried.

● COURSEWINNER is simple and quick to use, yet very powerful.

● Boxed with detailed instruction booklet.

Price £12.50 all inclusive IMMEDIATE DISPATCH (RETURN OF POST)

Available for:

SPECTRUM (48K), BBC(B), COMMODORE 64, DRAGON, APPLE II/IIe, ATARI (48K).

POOLSWINNER

The Ultimate Pools Prediction Program

● POOLSWINNER is the most sophisticated pools prediction aid ever produced. It comes complete with its own massive database.

● Can be used for Scoredraws, Draws, Aways and Homes.

● The database contains over 20000 matches (10 years league football). It updates automatically as results come in.

● The precise prediction formula can be set by the user. This allows development of your own unique method.

● Package is complete with program, database and detailed instruction booklet.

Price £15.00 all inclusive IMMEDIATE DISPATCH (RETURN OF POST)

Available for: SPECTRUM (48K), ZX81 (16K), BBC(B), COMMODORE 64, DRAGON, APPLE II/IIe, ATARI (48K).

Available from dealers or direct (return of post) from:

37 Councillor Lane, Cheshire. Phone: 061-428 7425

Tony Bridge's Adventure Corner

Instant death

Last week, I finished off by talking about *The Devil to Pay*, by Computascope. For Fun, and had a few sharp words to say about the spelling, grammar and general layout of the program.

I realise that spelling is not everyone's strong point, but the market for silly howlers has been cornered by Camell, and in other programs, careless mistakes just become tiresome — at best, exasperating. When, as in *The Devil to Pay*, we are treated to consistently mis-spelt words and bad grammar, one can only wonder if even the author has bothered to look at the game.

On to more new releases. First off, let's get the bad news over with. A considerable amount of high-powered advertising has been taking place over the past couple of months, in order to get you to part with your hard-earned cash in exchange for CRL's new adventure, *War of the Worlds*.

According to the very glossy adverts, it's a "strategic arcade adventure" — yet another combination of sales grabbing words. We'll come back to those classifications in a moment, but for now, let's look at the program.

After the titles, we're straight into the main playing area — almost, anyway! It's up to the player to find out that he has to touch a key before anything happens. This sort of thing is pretty obvious, I know, but it is the smallest effort to inform the user. Once into the game, we are presented with a condensation of the first few chapters of the book, complete with a feeble Spectrum-

ised version of the famous Jeff Wayne-written music; it's a pity that this opening sequence has to be sat through every time you want to play the game. Now to the game proper — you'll find it reminiscent of *Valhalla*, with your little man striding across the screen before a background of suburban semi-detached houses. The graphics are not exactly state-of-the-Art; the little stick-man is bearable, but the scrolling is very coarse and unconvincing.

The object of the game is your search for Carrie, the girl you love, and your adventures in this quest.

The Martians are invading the Earth and it is when they appear that the faint stirrings of doubt in the player's mind reach a crescendo. Despite the fact that the player may be getting along well in the adventure and strategic departments, suddenly along hops a 30-foot spider and zaps you with a red line! Well, it wobbles about a bit, luring you into thinking that you might escape it, but I'm afraid that skill has no place in *War of the Worlds*, and you are doomed to become Martian fodder.

It's a pity that the "arcade" (CRL's term for the extremely wimpy and unfair instant death) part of *WOW* makes the adventure parts so unrewarding to play.

The Odyssey of Hope comes from Mar-tech games, and is a graphic adventure. The tape contains two programs — on the first side, instructions and game, on the other side, the game alone, which seems a good idea. The instructions need a program all of their own, taking the form of an on-screen book. As you press Enter, the pages turn, and reveal the story of Pandora's Box. Hope has been stolen from the box, the Gods are angry, and it is your mission to recover it.

The graphics are pretty simple, but a constant on-screen read-out of visible objects and strong colours add to the interest.

Vic20 owners have had a rather rough time lately, with not many new adventures being released. It's nice to report, then, that a Vic owner (not an established software house) has taken matters into his own hands, and released *Adventure School* for his machine.

Richard Terry tells me that "as you might imagine, it is set in and around school. You start in a fish and chip shop and have to find five valuable objects. When these are found, you give them to your Mummy to

receive a surprise!" Probably a clip round the ear — you should be at home eating your dinner! For £4.50, or £4.00 if you enclose your own tape, you too can experience the delights of the local Chippy. Write to Richard at Stable Cottage, Englefield, Nr Teale, Reading, Berks RG7 5EL.

Artic were really the first adventure-writers for the ZX machines, and their infuriatingly simple-looking programs have been causing loss of hair, divorces and smashed television sets for many years now. Each new adventure has been received with gratitude by just about every Sinclair adventurer.

I'm afraid, though that the latest is a disappointment — which is unfortunate for the program's author, because A, B, C, and D (and, to a lesser extent E, *Golden Apple*) are all extremely hard to follow. The latest program, *Ground Zero*, is not, in itself, a bad adventure; the scenario has you in the wasteland of post-nuclear Britain. The problems you will meet are the ones you might expect — it's a pity, however that the location descriptions, as far as I've seen, are not particularly atmospheric.

This is, as Artic say, "a very large adventure", and these are first impressions. Gilsoft are entitled to a mention somewhere, Artic, so if you reprint this one, please ensure that mention is made of The Quill's involvement.

Talent Computer Systems is funded, in part, by the University of Strathclyde. They have recently released several programs — the one that interests us at the moment is *West*, a graphic adventure for the CBM64 and BBC/Electron. It's set in the year 1884, somewhere in the Wild West, and you are on the trail of a notorious gang of bank robbers. You must outwit and outgun them and recover the loot.

This is a very professional-looking program, well laid-out and with, thankfully, no spelling mistakes. The main picture is of the Main Street, and, as the day progresses, you will see the sky changing colour. The picture is generated by Talent's own graphic utility, *Panorama* — if this is the sort of picture that can be drawn with it, then *Panorama* can be recommended.

Apart from the bad habit of the Commodore's keyboard to hold your keypresses, the game is conducted very quickly. An adventure, in sum, about which I expect to get many questions. Buy it now from Talent Software, Curran Building, 101 St James Road, Glasgow G4 0NS.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Adventure Helpline

Going bananas? If you are stuck in an Adventure with nowhere to turn do not despair — help is at hand.

Fill in the coupon, explaining your problem, send it to us, and a fellow adventurer may

be able to help.

Remember — the system only works if those adventurers who have solved the puzzles get in touch. Every week is Save An Adventurer Today (SAAT) week!

Key decision

R McKean of Higher Blackley, Manchester writes:

Q I am considering the purchase of the Casio MT 200 keyboard featured on the cover of PCW dated May 24, but would like to make sure that the keyboard and necessary interface are compatible with my Dragon 32.

Also, could you give me any information on where to obtain details of the PA1 interface, as I am doing this as a college project.

A The Casio keyboard requires that the micro be able to receive the Centronics interface, which your Dragon can. To obtain more details of the PA1 interface you should ring Casio on 01-460 9131.

The age of Aquarius?

Q At Christmas I acquired an Aquarius computer. The main difficulty I find with it is the software (or lack of it). I have enquired in a number of local shops, which stock Vic 20, Electron etc software, but with no sign of anything for the Aquarius. Surely with all the publicity that was given this computer at Christmas time there should be by now more software available.

I would be grateful for any advice you can give me.

A The Aquarius has suffered from the cut-throat competition for space on the software shelves. As it did not make a major impact in the market it lost out in the software stakes.

Also, the decision by Mattel to drop the machine did nothing for its popularity with retailers or software houses. There is as you say a dearth of software for this machine.

Do not lose heart however, Radofin Electronics who manufacture the Aquarius and are committed to its continued development. My advice is to write them asking for the address of your nearest stockist of Aquarius computers as they will also stock the software. Radofin's address is: Radofin Electronics (UK) Ltd, Home Computer Division, Hyde House, London NW9 6LG.

A waiting game

E Sanders, Leamington Spa, Warwickshire writes:

Q I have long intended buying a computer, but because of the many new models coming on the market, I have deferred buying until things settle down.

I did have a ZX81, but something went wrong with it and I put it aside to wait for something better. Last week on the spur of the moment I bought a small computer, a Tandy MC10. It had been reduced to £39.95 as it is now obsolete. The machine has been described as a ZX81 with colour, and I thought it might be a more interesting machine to study machine code on. However, since buying it I have come to realise that although it is a very good quality machine there is very little in the way of books or software available for it. My local Tandy shop is no help, they seem to know less about computers than I do.

There appear to be no clubs or magazines which might help me, so I am writing to you in the hope that you can advise me. It is possible to upgrade this machine to 20K but there is not point in wasting more money if no information is available on the machine.

A Two possible sources of information for you are the Tandy User Group Remsoft, 18 George Street,

Brighton, and, of course, Tandy themselves at Tandy (UK), Tanmeway Tower Bridge Street, Walsall WS1 1LA.

I must say that I have a lot of sympathy for you, having held off for so long before buying a machine. I am surprised that your Tandy shop is no help as I have always found the staff in those shops to be particularly helpful.

I don't think that I would recommend that you upgrade your machine, at least until you have contacted the two addresses above and have determined what software and support is available for it.

Speed essential

M Symonds of Minsterworth, Glos writes:

Q I am a regular reader of your magazine. I own a Commodore 64 and would like to purchase a disc drive. I have seen the VIC 1540 drive but it is slow in disc terms, ie it takes 18 seconds to save a 6K program and 12 seconds to load it back. I would like to know if you can buy a disc drive which can load and save faster than the Vic 1540 disk drive.

A Commodore announced a new disc unit for the and Plus/4 at the Chicago CES which is claimed to be four or five times faster than the present unit. It should be available in this country in time for Christmas.

Commodore disc drives are notoriously slow. Even if you can't wait for the new drive to arrive, I don't know of any faster Commodore compatible drives that are available on the UK market at the moment.

One small point, if your interest is in merely saving and loading programs faster, why not buy one of the many cassette fast-load programs available for the CBM 64 to speed up cassette loading time.

Joystick trouble

Andrew Sweeney of Glasgow writes:

Q I hope that you can help me. For Christmas I was given a Cheetah 32K Rampack making my Spectrum into a 48K one. A few weeks ago, for my birthday, I was given a Kempston joystick interface. When I tried to use my joystick with the rampack I discovered to my horror that I could not. When I plugged in the interface I could not plug in the joystick.

Please could you give the name and address of someone who could help me? I just want to use the joystick for 48K games.

A I suggest that you contact Timedata, 16 Hemmels, Laindon, Basildon, Essex SS15 6ED who should be able to fix you up with a suitable connector. One last point, Cheetah maintain that their Rampack is "fully compatible with all accessories", have you put your problem to them?

If not I would, at least they will then be aware of the difficulties of using certain devices with their 32K Rampack.

Starting young

Mark Hadman of Whittlesey, Cambs writes:

Q Could you please help me with the following. I am nine years old and I would like to buy a cheap, easy to use Vic 20 machine-code book for complete beginners.

A Anyone who wants to learn machine-code at nine years old has got to have a future in this business. As a start, you could try *Advanced Basic and Machine Code Programming on the Vic* published by Duckworth. This retails at about £6.95 and is one of the cheapest and easiest books I've found.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek it* to Phil Rogers and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, 12-13 Little Newport Street, London WC2R 3LD.

ADVENTURE HELPLINE

Escape from Pulsar Seven/Golden Baton. How do you find the light. How do you find the parchment and how do you use the quartz against the lizard man? Leon Bolt, 72 Latimer Rd, Whipton, Exeter, Devon.

Denis through the Drinking Glass on Spectrum. I cannot find the flask of drink. Robert Nunn, 38 Palm Rd, Romford, Essex.

Espionage Island on Spectrum. I can't get further than the native woman. Edward Callan, 48 Raheen Ave, Tallaght, Dublin 24.

Planet of Death of Spectrum. I have got past the forcefield but I cannot get my space ship free. What does 'no dusty bin rules' mean in the lift, and can you shoot the guard? Mark Rugman, 734 Derby Road, Wingerworth, Chesterfield.

The Hobbit on Spectrum. How do I avoid recapture after escaping from the goblin's dungeon? Where is the magic ring? John Hedeas, Flat 5, 55 Oxford Rd, Littlemore, Oxford.

Ring of Power on Commodore 64. On the second level, having crossed the sea, there is an exit 'up' on the beach. But when I try the location is merely repeated. How do I go 'up'? P Barnard, 16 Ashwood Rd, Ru-

dloe, Corsham, Wilts.

Fantasia Diamond on Spectrum. I can't cross the river; what does 'wait for it' mean? Kevin Doull, 5 Lindsay Place, Wick, Caithness.

Murder at the Manor on Spectrum. Where is the ladder? Where is the manor? GUR Howard, 31, Springfield Rd, Windsor, Berks.

Zork 1 on Commodore 64. How do I get into Hades and how do I open the grating? Nigel Norse, 11 Green Leaf Ave, Wheatley Hills, Doncaster.

McKensie on Spectrum. How do I get out of prison? What is the rusty robot for? Mark Hutchinson, 61 Church Rd Church Hotel, Franworth, Bolton.

1915 Pirates Cove on Vic20. We cannot get out of alcove and do not know any magic words. Mrs S Johnson, Greenbanks, St Austell Rd, Probus, Cornwall.

Alchemist on Spectrum. I cannot find the spell of destruction or any more locations. Tim Hortopp, 53 Walcheren Place, Hamworthy, Poole, Dorset.

The Quest of Merravid on Vic20. Once you have killed the dragon, how can you get the firestone? Ian Swan, Nether Cambushinnie Cottage, Kinbuck, Dunblane, Perthshire.

Dungeon on Spectrum. I can't get past the giant rat. I can't get past the swirling grooved rock. I can't enter where the splintered flint hurls you back. J E Tyson, Post Office Langport Somerset.

Arty

Graphix IV is probably the cheapest Commodore 64 extension to Basic program I've yet seen at £9.99. And as any C64 owner will be only too aware the machine could do with one.

This program adds 16 new commands to the machine, all of which are concerned with graphics. The actual program resides at \$C800, and so doesn't conflict with ordinary Basic.

Colour sets the foreground and background plotting colours in high res. *Draw* draws a line from a point previously defined. Other commands include *Paint*, *Plot* and *Character* which allows the character set to be easily redefined.

The program comes with a useful manual explaining how to use the new commands.

Graphix IV may not have the extra sound commands of some other Basic extensions but then look at the price difference.

Get the Bird

Fantasy have previously been known for arcade games like *Pyramid* where you zapped a variety of aliens in seemingly endless chambers. To a certain extent then *Beaky and the Egg Snatchers* is a break with tradition.

Although featuring the usual high quality sprite graphics this game has more of a plot, in fact it has so much plot it's nearly impossible to describe.

Basically there are these birds which you control and you must preside over the development of some eggs into chicks. This involves three stages, egg collecting, egg brooding and chick rearing.

The first of these involves shooting evil egg snatchers whilst in flight. This is because you are unable to pick up the

eggs yourself; when the egg is dropped by the egg snatcher you must catch it in mid air and drop it into the nest.

Other stages involve avoiding snowflakes and frogs, and pouncing on flying worms. You'll forgive me if I don't try to explain them. It's pretty wonderful, provided you have the patience to read through the instructions and figure out what you're supposed to do.

Pared Price

Whether in the end they are the iconoclastic mould breakers they believe, Mastertronic have certainly stirred up something. Whilst as yet there's been no massive move towards reduced prices for mainstream games, companies have certainly seen that there is a market for less spectacular but cheaper games.

To this end, I would guess, Cases Computer Simulations are releasing a new range called *Charlie Charlie Sugar*, which consists of various games, all of which might loosely be described as puzzles at a mere £2.99.

Matching Pairs is a souped up version of that old favourite Pelmanism (that was cribbed

Pick of the week

LOGO LOWDOWN

Sinclair has released *Logo* — the graphics (amongst other things) language. Those in the know (people who mumble on and on about the relative merits of one language over another) tell me it's one of the best versions of the language available on a home micro.

The package consists of the program and two manuals, *Logo 1* and *Logo 2*. Roughly speaking, *Logo 1* does what you always knew *Logo* could do; ie draw patterns using principles of maths and geometry. *Logo 2* proves that you can do a great many things besides, including the manipulation of words and numbers.

As computer languages go, *Logo* is more fun for the 'dabbler' than most because of the construction of patterns and

other wonderful things. The two manuals look excellent and would seem to cover virtually any question you could have about the use of *Logo*. Basic driver routines for a robot are also included as is a reference card listing the commands.

You can guess that a 48K program plus two manuals is not going to come cheap — in fact (I think) it's the most expensive Sinclair software ever at £39.95. On the other hand, it's cheap compared to its rivals and beautifully packaged. Start saving your pennies.

from the liner notes — it's not an old favourite of mine) where the player has to remember the position of various letters of designs on the reversed faces of a table of cards — the idea is to find all the pairs in as few guesses as possible or alternatively, before another player.

This computer version of the game lets you play either alone or in competition and boasts five, ever more complex patterns. It is a nice interpretation of a simple game and at the price, some people at least may find it more satisfying than the latest space shoot em up at six or seven pounds (but then what isn't). Despite the dire warnings of imminent industry collapse if games are sold for these sort of prices, for the moment, anyway, I think they are a good thing.

Gulag

You may have seen some advertisements recently for a number of programs by a new

company which modestly calls itself Talent and has a range of programs primarily for the Commodore and BBC.

One of the programs is an adventure called *West* about which you can read a lot more (suffice to say that it's rather special) from the likes of Tony Bridge. I decided to have a look at one of the arcade games — *Archipelago*.

The title screen on this game is absolutely wonderful — as good as *Alice in Videoland* but the game was a bit of a disappointment. *Archipelago* proved to be a maze game with very simple graphics.

Using the joystick, you move a little man around a maze (which looks a bit like a crossword puzzle layout) collecting diamonds and avoiding spiders. In fact, it's not a bad game — very fast and addictive with the spiders acting very 'intelligently' as they try to entrap you.

So — marvellous title screen (a great sales job for the company's screen designer program), disappointing game graphics, but quite a fun game.

Program *Archipelago*

MULTI OPTIONS

I wonder how the Electron is doing; it doesn't have a surfeit of programs for it — but then maybe it just hasn't been around long enough yet.

However, what programs there are come mainly from established BBC software houses, one such is Superior Software. It has released a version of that game of games, Chess.

It is unfair to judge something like a chess game on a quick review, you have to play a while to get the 'flavour'. What one is left with are peripheral aspects of the program.

This Chess has a lot of features — skill, speed, look ahead, etc, can all be changed — moves can be entered by cursor, coordinate or joystick. There are options for next worse move, next better move, worst move and best move play from the computer, as well as function key commands to alter display, etc.

It is, in short, a very well designed program with just about any feature you could possibly want in a chess program.

Page the Oracle

Spectrum owners may remember that a while ago — just

before the release of *Valhalla* — there was what could loosely be termed an animated graphics adventure called *The Oracles Cave* by Dorcas Software.

The game featured an animated man who walked left and right, climbed ropes and fought monsters (or ran away) as instructed by key presses.

The game is on a time limit of five computer 'days' — time is ticking away all the time and whilst sleeping can restore vital energy, it also wastes time.

There is treasure to collect and a variety of more and less useful objects to be discovered as you descend through a series of caves hoping to make your escape via the Oracles Cave at the bottom level.

The game is now faithfully reproduced in a Commodore 64 version complete with hi-res graphics and turbo load. If you fancy an adventure which combines dungeons and dragons, strategy and hi-res animated graphics, then it's well worth a look.

Looking good

The first titles for the new Amstrad computer have been released. In the months before the release of the machine, Amstrad were busy arranging with a

variety of well-established software houses for programs to be available in time for the launch of the machine (other hardware manufacturers please note).

Obviously a 'standard' has not been built yet for the machine and these first programs are not going to push the machine to its limits, such as some of the more recent programs on the Spectrum.

Looking at a range of new packages I chose *Spannerman* by Gem Software. On loading what you get looks rather like a Commodore 64 game I think, perhaps because of the monitor, the graphics were a little better — the details of the man's overall and cap were clearly visible. The sound was marginally worse — certainly it ought to be worse using as it does the same boring old sound chip as 80% of all micros but I did like the 'nut tightening' noise. (Note to hardware designers, the new Yamaha sound chip available for some of the MSX machines is going to make even the Sid look pretty silly — be there or be square.)

The game is pretty good although infuriating. You control Spannerman whose job it is to repair a series of leaky pipes (a thought — if Spannerman is 'a man who uses a spanner in his job' then could a journalist be called Typewriterman?) before a building floods.

Aside from the sheer logistical problem of moving from leak to leak, various unlikely objects are tumbling down threatening to biff you on the head. There is a variety of life-threatening rodent that scampers back and forth along the pipes that can only be thwarted by a swift kick (shades of *The Young Ones* here).

I liked the game, and it represents not a bad start for the machine at all — in terms of programs what we might have in the Amstrad is the Commodore 64 plus better (slightly) graphics plus better (even excellent) Basic plus (possibly much) faster run times, minus sound quality. Things look good.

Battling Bikers

What a lot of people said they didn't like about *Chequered Flag*, Psion's car race program, was the absence of competing cars. All you could do was try to better your own lap time on a variety of circuits.

Full Throttle is the latest release from Micromega whose excellent *Star Trek* style game *Codenamed Mat* is still high in the charts. It does for motorbike racing what *Chequered Flag* didn't do for cars; ie, it puts competitors on the track.

Many of the technical effects on the game would seem to have been derived from another Micromega game from the same author — *Death-*

chase. As you zoom around the rack other bikes weave in front of you, try to pass you and generally make life difficult; hit one and you lose valuable position time. You have to manoeuvre your bike not only, therefore, around the bends and swerves of the track, but through the dense group of fellow bikers — no easy task.

Sensibly Micromega have kept the controls simple, bank left, bank right, accelerate and brake. There are a variety of different courses based on real tracks with differing properties and demanding differing skills. Fun to play and technically very clever.

Wishful thinking

Talk about wishful thinking, a book on the Vic20 for £11.65 *Mastering the Vic20* is a general 'introduction to' type of book with the usual mish-mash of Basic commands explained and simple programs. If it were even £6.95 it would only be averagely OK, at £11.95 they have to be joking.

The back cover blurb also describes the Vic as 'one of the most powerful and versatile personal computers around' — are they kidding? What year was this book written in?

The mind boggles

All things considered I'm surprised at how few books there are on the mind boggling subject of artificial intelligence

there are. Fewer still that actually give you programs to type in. *Exploring Artificial Intelligence on your Microcomputer* is one such book.

A.I. which is what we buff term it, is one of those topics that cover a multitude of significantly different areas. These range from Eliza-type pseudo compassion and understanding, to database crunching expert systems, to Tictac as a computer that learns what not to do from mistakes.

All of these programs appear in this book and apart from doing some things that some people consider has something to do be artificial intelligence, they have little in common.

That said, there is quite a lot of background text about the history of A.I. and commentary on how each program works and some analysis of in what way each one could be said to be intelligent. The programs too, are pretty good, particularly the Eliza which is absolutely the smartest version of this old chestnut yet.

All square

Puzzle no 118

"Here is an interesting problem," remarked Professor Hex, at the monthly meeting of Mathemaholics Anonymous. "Can you find a perfect cube that is two million more than a perfect square?"

There was a moment's silence before a voice announced "Twenty-seven million!" Sure enough, twenty-seven million, the cube of three hundred, is just two million more than twenty-five million, the square of five thousand. "Er, yes," mumbled the Professor, reddening slightly at being caught so easily. "That wasn't the answer that I was thinking of."

Can you find an alternative answer?

Solution to Puzzle no 113

We know that Alison must have earned an amount (in whole pence) somewhere in the range 1p to £3.40. If we knew this amount, all the other sums earned are determined by subtracting the known value from each pair, in turn, along the line.

However, each amount must be positive, and also the sum raised by Alison, Chris and Elizabeth must equal £5.18.

The program tests every value possible for Alison's total, works out the remaining sums, and prints any possible results found.

10 FOR A = 1 TO 340 20 LET B = 341 - A 30 LET C = 287 - B 40 LET D = 223 - C 50 LET E = 469 - D 60 IF C > 0 AND D > 0 AND E > 0 AND A + C + E = 518 THEN PRINT A, B, C, D, E 70 NEXT A

This gives the following result: Alison, £1.27; Ben, £2.14; Chris, £0.73; Derek, £1.50; and Elizabeth, £3.18.

Winner of Puzzle No 113

The winner is: Ms C S Gwilliam, Sheppard Way, Minchinhampton, Stroud, Glos, who receives £10.

Rules

If the puzzle can be sensibly solved using a computer then the winner will have included a listing of the program used to find the correct answer. The closing date for entries to Puzzle No 118 is August 17.

A fast buck

The campaign against piracy of computer programs has begun to increase pace, with a ten-minute rule Bill being introduced in Parliament on July 24.

It seems as if the Bill will have the support of the Government because it is felt that the computer industry should be in a position to protect itself against unlawful copying. It is true, unfortunately, that the one good reason to distribute software with an essential manual is that the law of copyright applies to the manual.

In the case of some microcomputer products, the sales of books and manuals to accompany software far exceed the sales of the software itself. It could be that there are many people using the same software on one machine, and each wants a personal copy of the documentation. But it is far more likely that each manual will accompany a separate pirated copy of the software.

The Bill is expected to include provisions for unlimited fines, and up to two years in jail, for those who copy, with lesser penalties for those who sell.

So, who are the copiers against whom the Federation Against Software Theft (FAST) wishes the Bill enacted?

There are those who use systems on mainframes, which are illegally copied from

systems at other installations. By the very nature of large installations such copying is difficult to conceal and, as software is usually sold on licence, the origin of the copy is not that difficult to ascertain, and prosecute. If the Bill aims to curb industrial espionage, there are legal remedies already in existence.

In contrast, there is the microcomputer games player who is part of a "copying collective". Originals of games are bought, and then multiple copies are made, to be exchanged for other copied games. There may be micro games players who have no copied games in their possession, but they are rare creatures.

Micro games players tend to be young, and the Draconian measures envisaged in the Bill seem somewhat mediaeval in nature for this category of offenders. The number of such juvenile offenders is into the millions, and so a Bill, if stringently enforced, will bring the legal system to a halt.

The Bill, therefore, cannot be applied to minors, and — even if parents were held responsible — could not be applied to many. So at best, the Bill will help curb only the commercial scale games pirate and will do nothing to solve the main problem — home copying. The main impetus behind FAST and the promoters of the Bill comes from the games companies. Games are by their nature ephemeral. And games producers and retailers have consistently over-estimated the size of the market.

Their theory goes that if there was less copying many more games would be sold. This is a hypothesis the truth of which I strongly suspect. The total amount of money spent on games would not greatly increase, and players would swap originals rather than copies.

You cannot stop mass copying — or swapping — by individuals rather than organisations using legislation.

To create an industry based purely on entertainment is always dangerous, and for micro games the bucks are FAST running out.
